EXECUTIVE PERFORMANCE REVIEW

TrustMRR Platform Deep Dive

Revenue Concentration, Growth Signals, and Strategic Priorities
Across 1,000 Listed Startups

Prepared for Executive Leadership | August 4, 2026

Source: TrustMRR 1,000-Row Dataset, frozen 30 Jul 2026

A power-law market, hiding a $7.6M blind spot

48%

of total platform MRR ($13.47M) is generated by just the top 10 companies (1%) — this is a power-law market, not a normal distribution.

26.5%

of total MRR comes from a single company, Stan ($3.57M) — the single largest concentration risk in the dataset.

56.5%

of total MRR sits behind rows with no category tag — including 129 anonymized “Stealth Company” listings worth 28% of platform MRR.

5.7x

higher median MRR for B2B startups ($1,036) vs. B2C ($181) — audience type is one of the clearest revenue levers available.

19.7%

of all 1,000 listings report $0 MRR — a substantial pre-revenue long tail alongside the scaled winners.

42.7%

of listings show exactly 0.0% 30-day growth — likely a data-pipeline artifact, not genuine flatlining (see Limitations).

CONTEXT

What we analyzed

1,000
Startup listings (record_id unique)

29
Data fields per listing

1 snapshot
Frozen 30 Jul 2026 (no historical series)

65
Countries represented

Metrics available

- Revenue: 30-day, 3-month, 12-month, and all-time revenue; current MRR
- Momentum: 30-day revenue growth % and 30-day MRR growth %
- Scale: active subscriptions, website visitors (30d), revenue per visitor
- Profile: category, audience type (B2B/B2C), pricing model, country, payment provider
- Marketplace: on-sale flag, asking price, revenue multiple, domain rating, X followers

Assumptions & scope

- "MRR" = the mrr_usd field (current monthly recurring revenue snapshot).
- Median is used as the primary measure of a "typical" startup throughout, because the underlying revenue distribution is extremely right-skewed (skew ≈ 27).
- No month-over-month or quarterly time series exists in this dataset — "trend" analysis relies solely on the point-in-time 30-day growth % fields, not a true historical trendline.
- Rows with a blank field were excluded from that field's specific calculation, not dropped from the dataset entirely.

Headline numbers mask an extreme skew

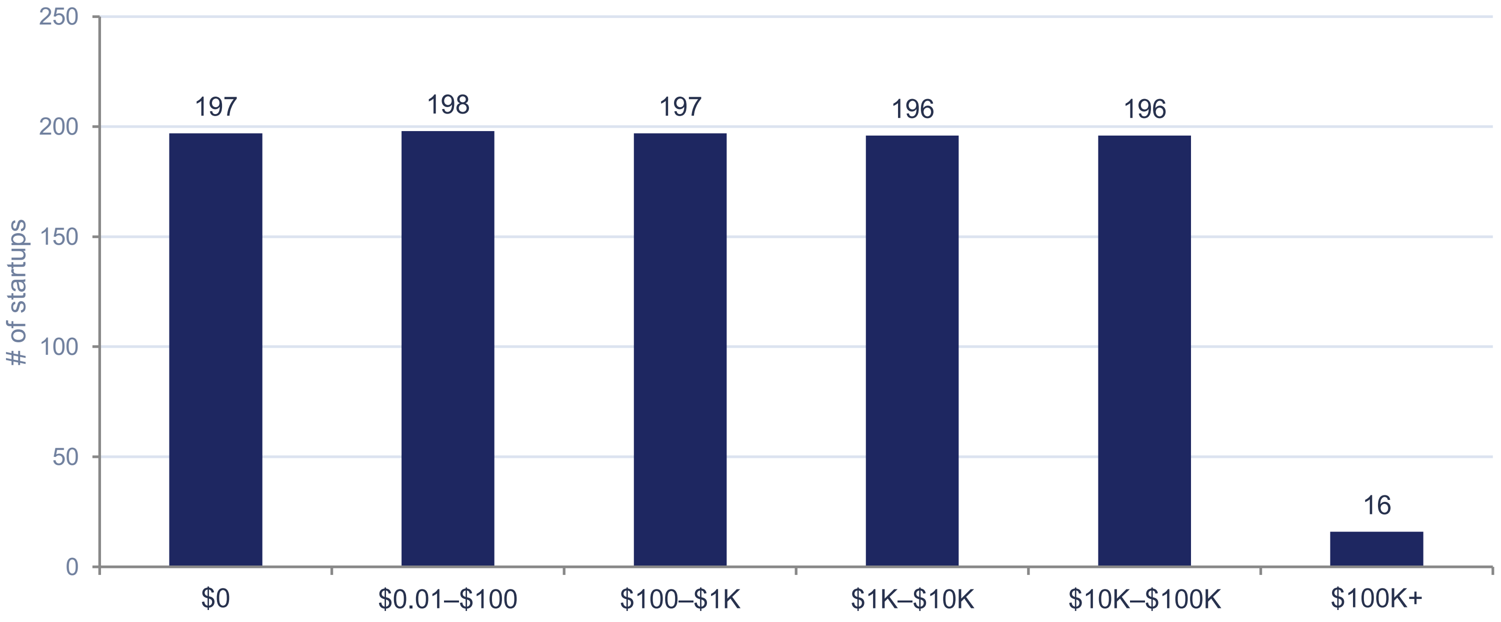
$13.47M
Total platform MRR

$13,472
Mean MRR per startup

$282
Median MRR per startup

27.1
Skewness coefficient (extreme right skew)

Distribution of startups by MRR tier

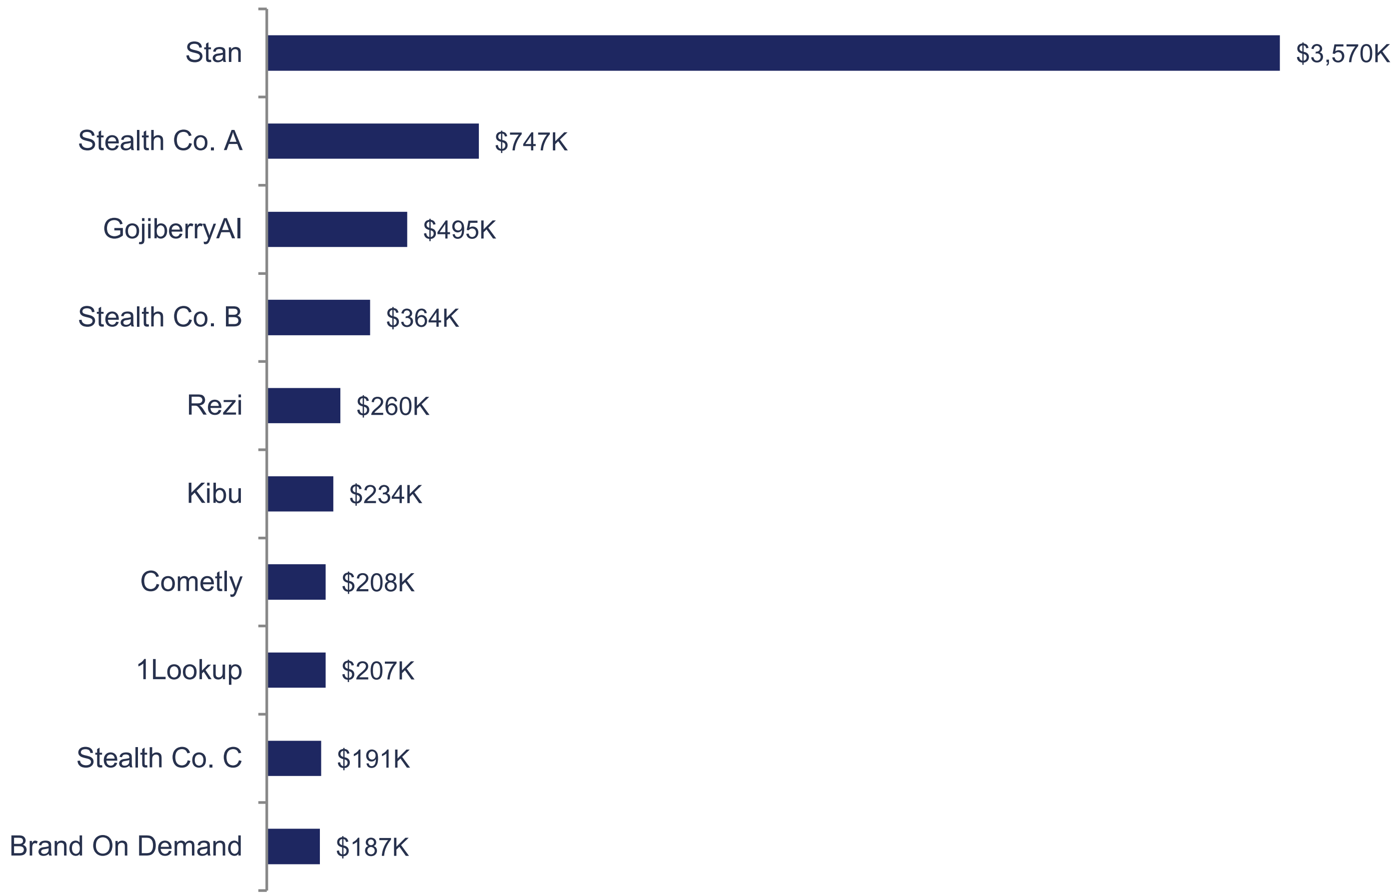


Reading the mean vs. median gap

The mean ($13,472) is 48x the median ($282). This is not a rounding artifact — it means the “average” startup figure is meaningless on its own.

Any leadership discussion should quote the median for “typical” performance and reserve the mean for total-portfolio-value discussions only.

Revenue is concentrated in a handful of winners



48%

of total MRR held by the top 10 companies (1% of listings)

81.8%

of total MRR held by the top 100 companies (10% of listings)

197

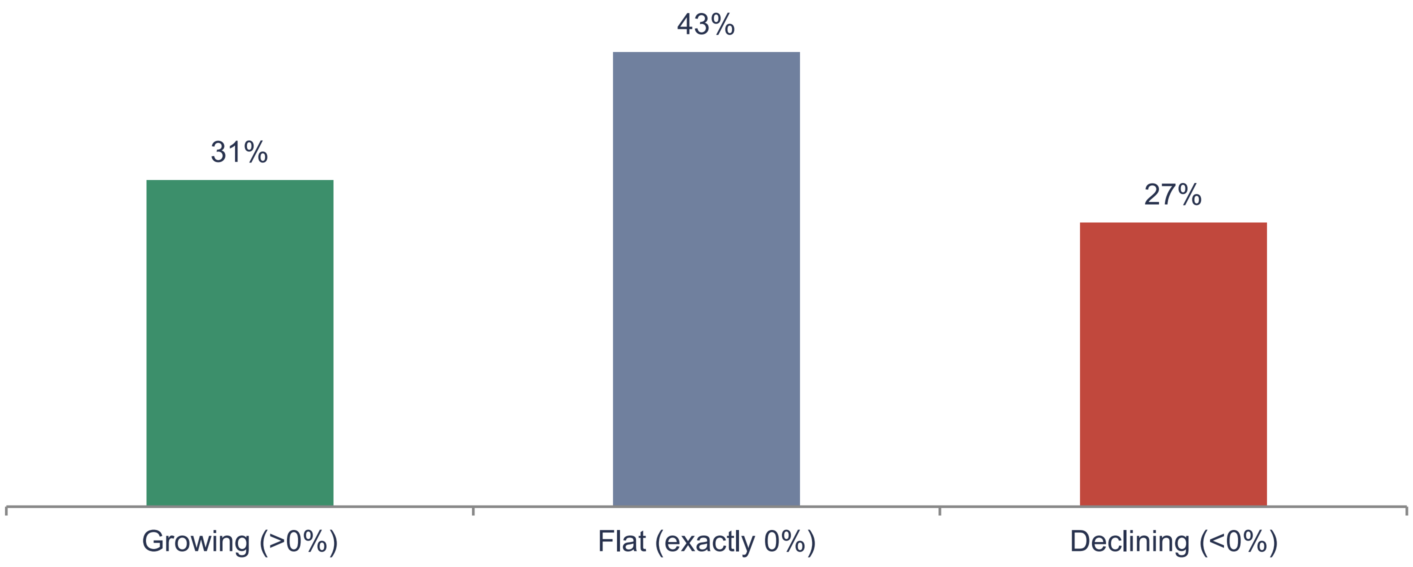
startups (19.7%) report $0 MRR — a large pre-revenue long tail

3 of the top 10 are “Stealth Company” listings — real identity and category are withheld from this data.

TREND ANALYSIS

No historical time series exists — momentum is a single 30-day snapshot

30-day MRR momentum split (n = 893 listings with growth data)



Data-quality flag

42.7% of listings show growth of exactly 0.0% — for a live marketplace, an identical zero across ~4 in 10 companies is far more consistent with missing/default data than genuine no-change. We recommend validating this field with the data source before using it for forecasting.

Where real momentum shows up

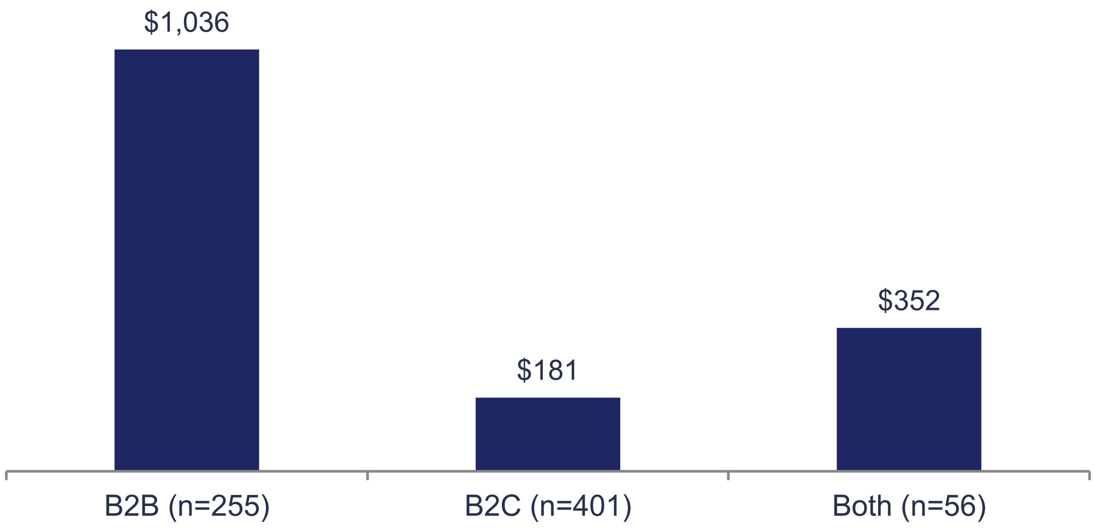
Dev Tools is the only major category (n≥15) with positive median 30-day growth: +8.9%, vs. 0.0% for every other major category.

All other top categories — AI, SaaS, Mobile Apps, Marketing, Education — show a 0.0% median 30-day growth rate.

Caveat: given the flat-0% data-quality flag above, this should be read directionally, not as a precise growth figure.

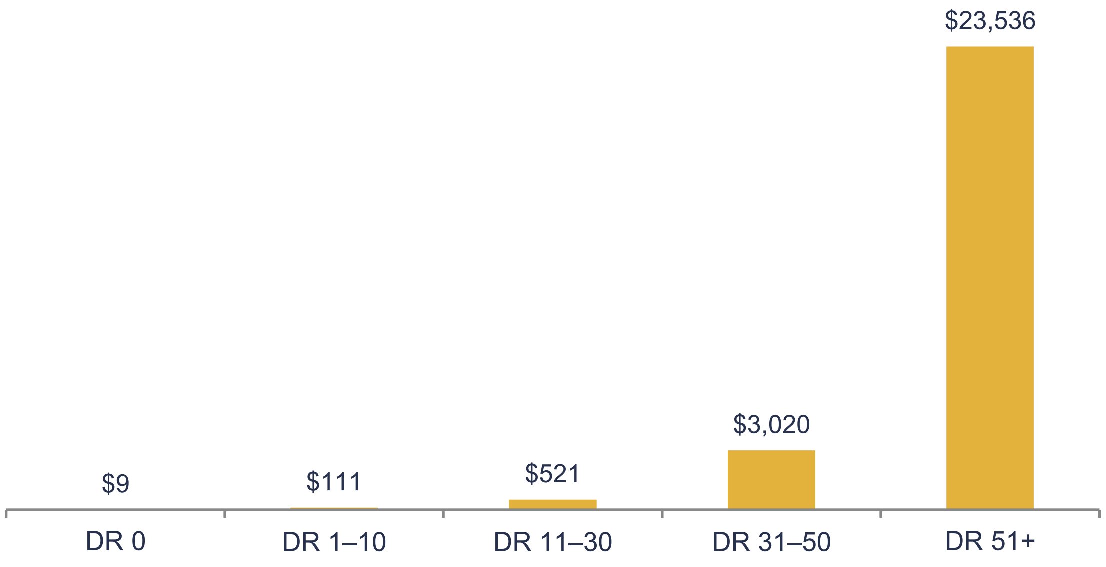
Audience type and domain authority both track revenue cleanly

Median MRR by audience type



B2B startups post 5.7x the median MRR of B2C peers.

Median MRR by domain rating tier

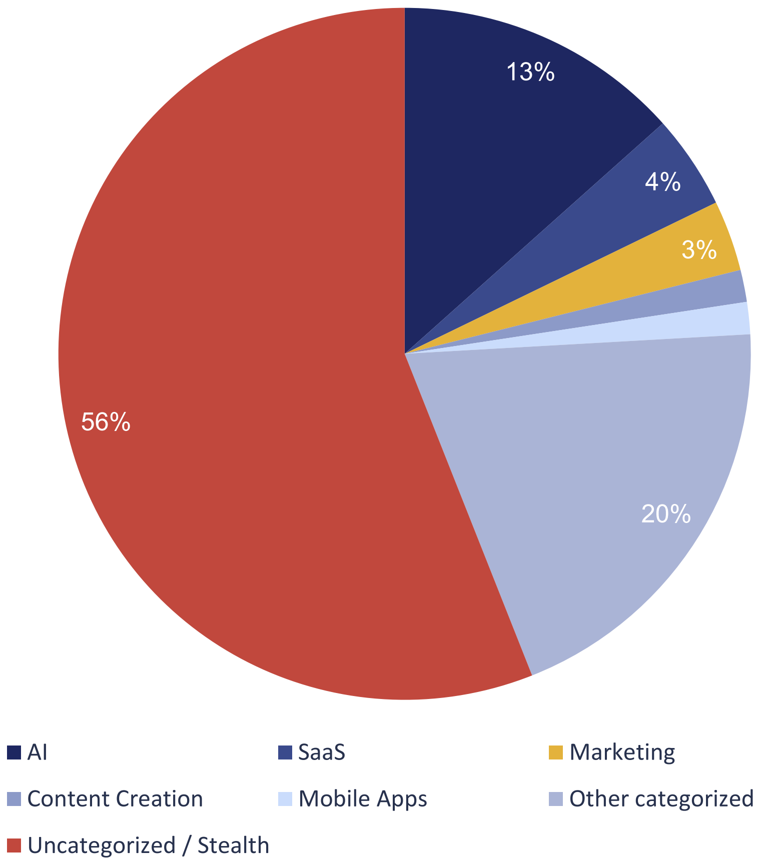


Median MRR rises monotonically with domain authority — from $9 (DR 0) to $23,536 (DR 51+).

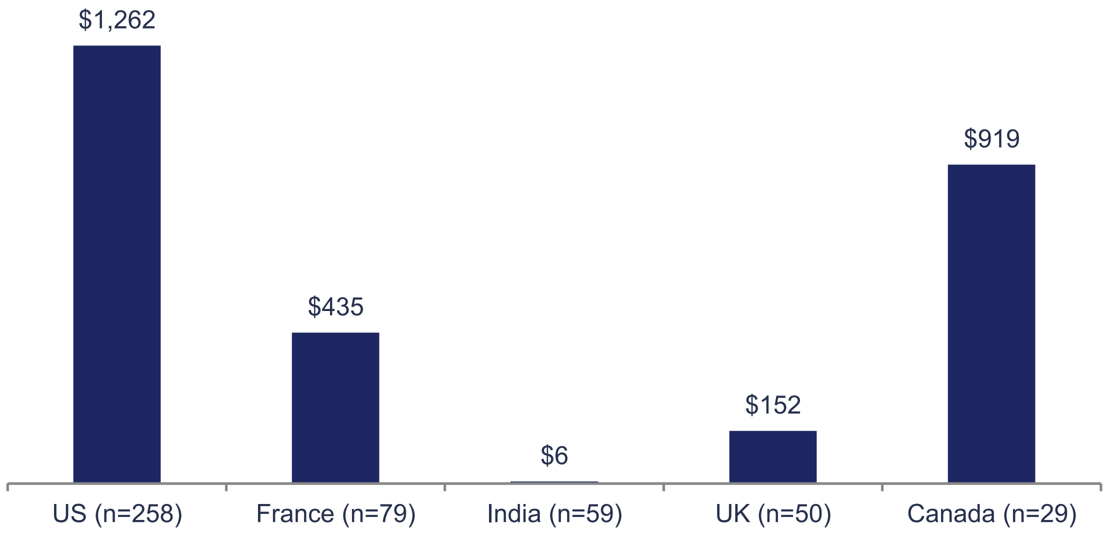
INSIGHT Both signals point the same way: durable, discoverable, business-facing products earn more. Neither is guaranteed to be causal from this data alone.

Category labels understate where the revenue really is

Share of total MRR by category



Median MRR by country (top 5 by listing count)



India has the 3rd-most listings (59) of any country, but the lowest median MRR ($6) of the top 5 — volume of listings is not a proxy for revenue concentration.

What's driving revenue — and what isn't

Driver	Corr. with MRR	Read
Active subscriptions	0.91	Strong
Asking price (if for sale)	0.81	Strong
Domain rating	0.21	Weak-moderate
30-day growth %	0.03	None
X (Twitter) followers	0.02	None

Correlation of each field with mrr_usd, across all 1,000 rows.

What's happening: Revenue is concentrated in a small set of subscription-scale winners; vanity metrics (followers, self-reported growth %) don't predict who they are.

Why it matters: Any resourcing, partnership, or investment decision based on “who's trending” risks missing the companies that actually carry the platform's revenue.

The blind spot: Over half of total MRR sits behind anonymized or uncategorized listings — category- and country-level strategy is being built on the smaller, better-labeled half of the business.

What to watch: Domain rating and audience type (B2B) are the two available signals that scale cleanly with revenue — worth validating as leading indicators going forward.

Five data-backed actions for leadership

1

Manage as a power-law portfolio

Build differentiated engagement for the top ~1% (whale accounts) vs. the long tail of 197 pre-revenue listings — a single blended strategy underserves both.

2

Close the anonymized-revenue blind spot

Prioritize getting category, country, and audience data on “Stealth Company” and other unlabeled listings — they represent 56.5% of total MRR and are currently invisible to segment analysis.

3

Double down on B2B and domain-authority signals

These are the two clearest, cleanest correlates with revenue available in the data — worth testing as qualification criteria for outreach, promotion, or investment.

4

Fix or retire the 30-day growth field before using it

42.7% of listings reading exactly 0.0% growth suggests a data pipeline issue; validate against source systems before this metric drives any decision.

5

Treat listing volume and revenue as separate KPIs

India leads in # of listings among major countries but trails badly in median MRR — geographic expansion plans should track revenue, not signups, per market.

Read this analysis with these constraints in mind

Coverage & measurement

- No historical time series: only point-in-time snapshots and a 30-day growth % field exist — there is no way to build a true monthly/quarterly trendline from this dataset.
- The 30-day growth field itself looks unreliable: 42.7% of non-null values are exactly 0.0%, which is more consistent with a data default than real flatlining.
- Extreme outliers (Stan; several “Stealth Company” rows) dominate any mean-based statistic — medians are used throughout, but even category-level medians can shift with one large listing entering or leaving a group.

Missing data & scope

- Substantial missingness across descriptive fields: category (27.4%), country (24.1%), audience type (28.8%), pricing model (34.3%), and especially traffic data — visitors_30d is 82.2% missing.
- 129 rows share the placeholder name “Stealth Company” with no category or country — they represent 28.1% of total MRR but cannot be segmented by any descriptive field.
- asking_price_usd and revenue_multiple are only populated for the 26.2% of listings marked on_sale — marketplace-pricing conclusions apply to that subset only, not the full dataset.

CLOSING SUMMARY

Three things leadership should take away

1

This is a winner-take-most market.

10 companies drive 48% of platform MRR; strategy, pricing, and support models should reflect that concentration rather than treat all 1,000 listings as comparable.

2

The best data doesn't cover the biggest revenue.

56.5% of MRR sits behind uncategorized or anonymized listings — closing that data gap is a prerequisite for any confident segment-level strategy.

3

Two clean signals exist — use them, validate the rest.

B2B focus and domain authority both track revenue reliably; the 30-day growth field does not, and should be fixed before it informs decisions.
