TRUST MRR - PORTFOLIO STRATEGY REVIEW

Where the Trust Business Really Stands

A data-driven read on scale, growth, concentration risk, and where engineering should invest next - based on the 1,000-listing verified-revenue sample (frozen 30 Jul 2026).

Prepared for Senior Leadership • Product, Growth & Engineering Strategy

August 2026

A $13.5M portfolio that looks concentrated, half-classified, and still accelerating

Five findings should shape the next two quarters of product and engineering priority - more than half the revenue base is invisible to category-level reporting.

01

Scale is real, ownership is narrow

$13.47M total MRR across 1,000 listings - but one account (Stan) is 26.5% of it, and the top 10 accounts are 48%.

02

56% of MRR has no category tag

$7.6M in MRR - led by one whale account and 114 stealth-mode listings - sits outside the taxonomy. Every category ranking below is a read on <44% of the business.

03

Momentum is turning up, not down

30-day revenue run-rate ($15.6M) is running ~40% above the trailing 3-month monthly average ($10.8M) - the portfolio is re-accelerating.

04

B2B is the better dollar, not the bigger crowd

B2B listings are 5.7x the median MRR of B2C and grow ~4.5x faster, despite being outnumbered 401 B2C to 255 B2B listings.

05

Infrastructure and data hygiene are the real bottlenecks

87% of MRR runs through a single payment integration (Stripe); domain authority barely correlates with revenue (r=0.21) or growth (r=-0.07) - SEO is not the growth lever teams may assume.

A mid-seven-figure MRR base built on 1,000 verified listings

Scale looks healthy on every top-line metric - the next slides test how durable and well-distributed that scale actually is.

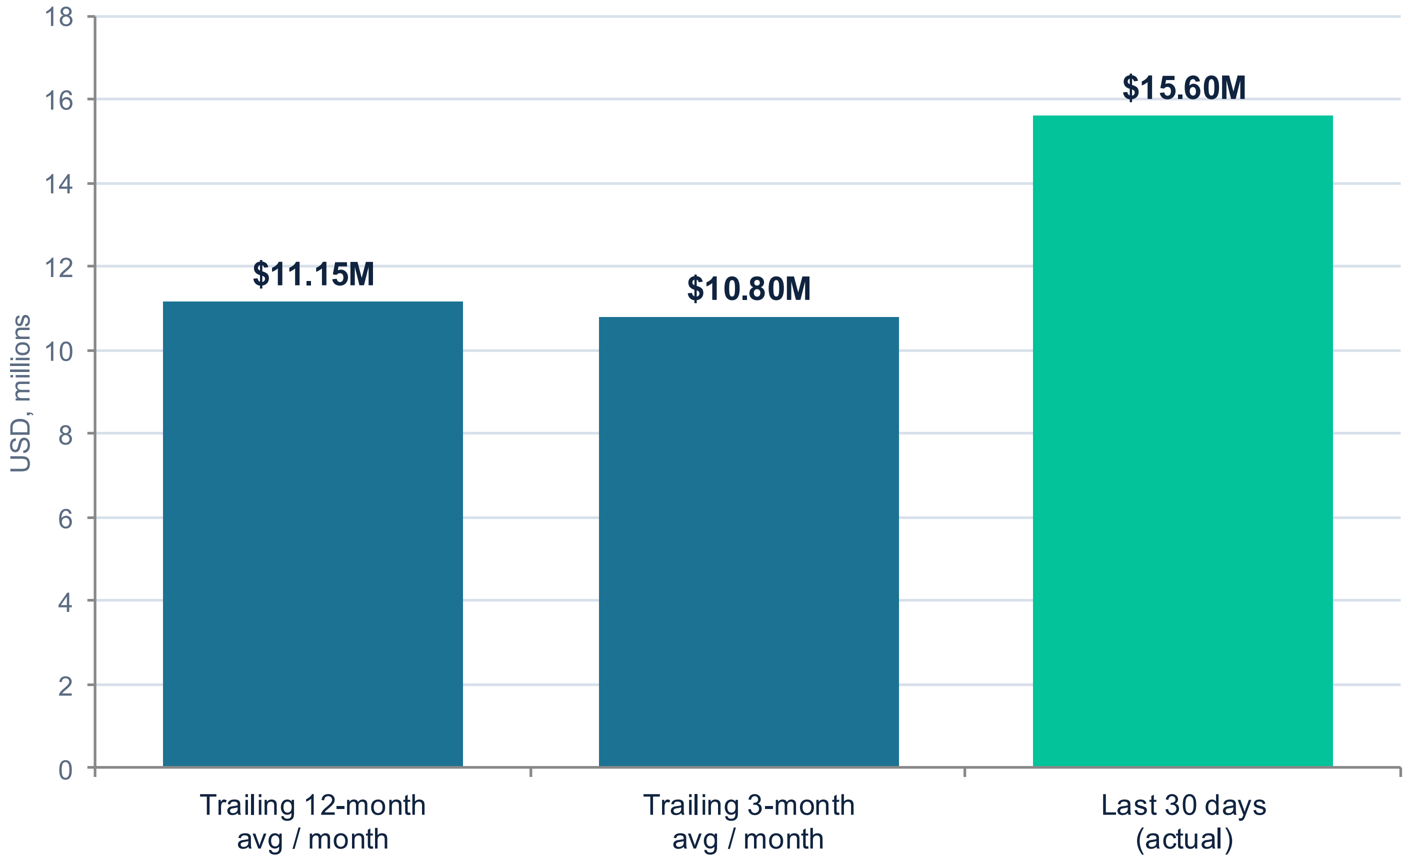
GROWTH TRAJECTORY

The portfolio is re-accelerating: the last 30 days outpaced the trailing trend by ~40%

Monthly-equivalent revenue has stepped up from an $11.1M 12-month average to a $15.6M 30-day run-rate.



Read it as acceleration, not noise

All three windows use the same definition (portfolio revenue ÷ months). A ~40% step-up from the 3-month run-rate is too large to be rounding.

But treat per-company growth % with care

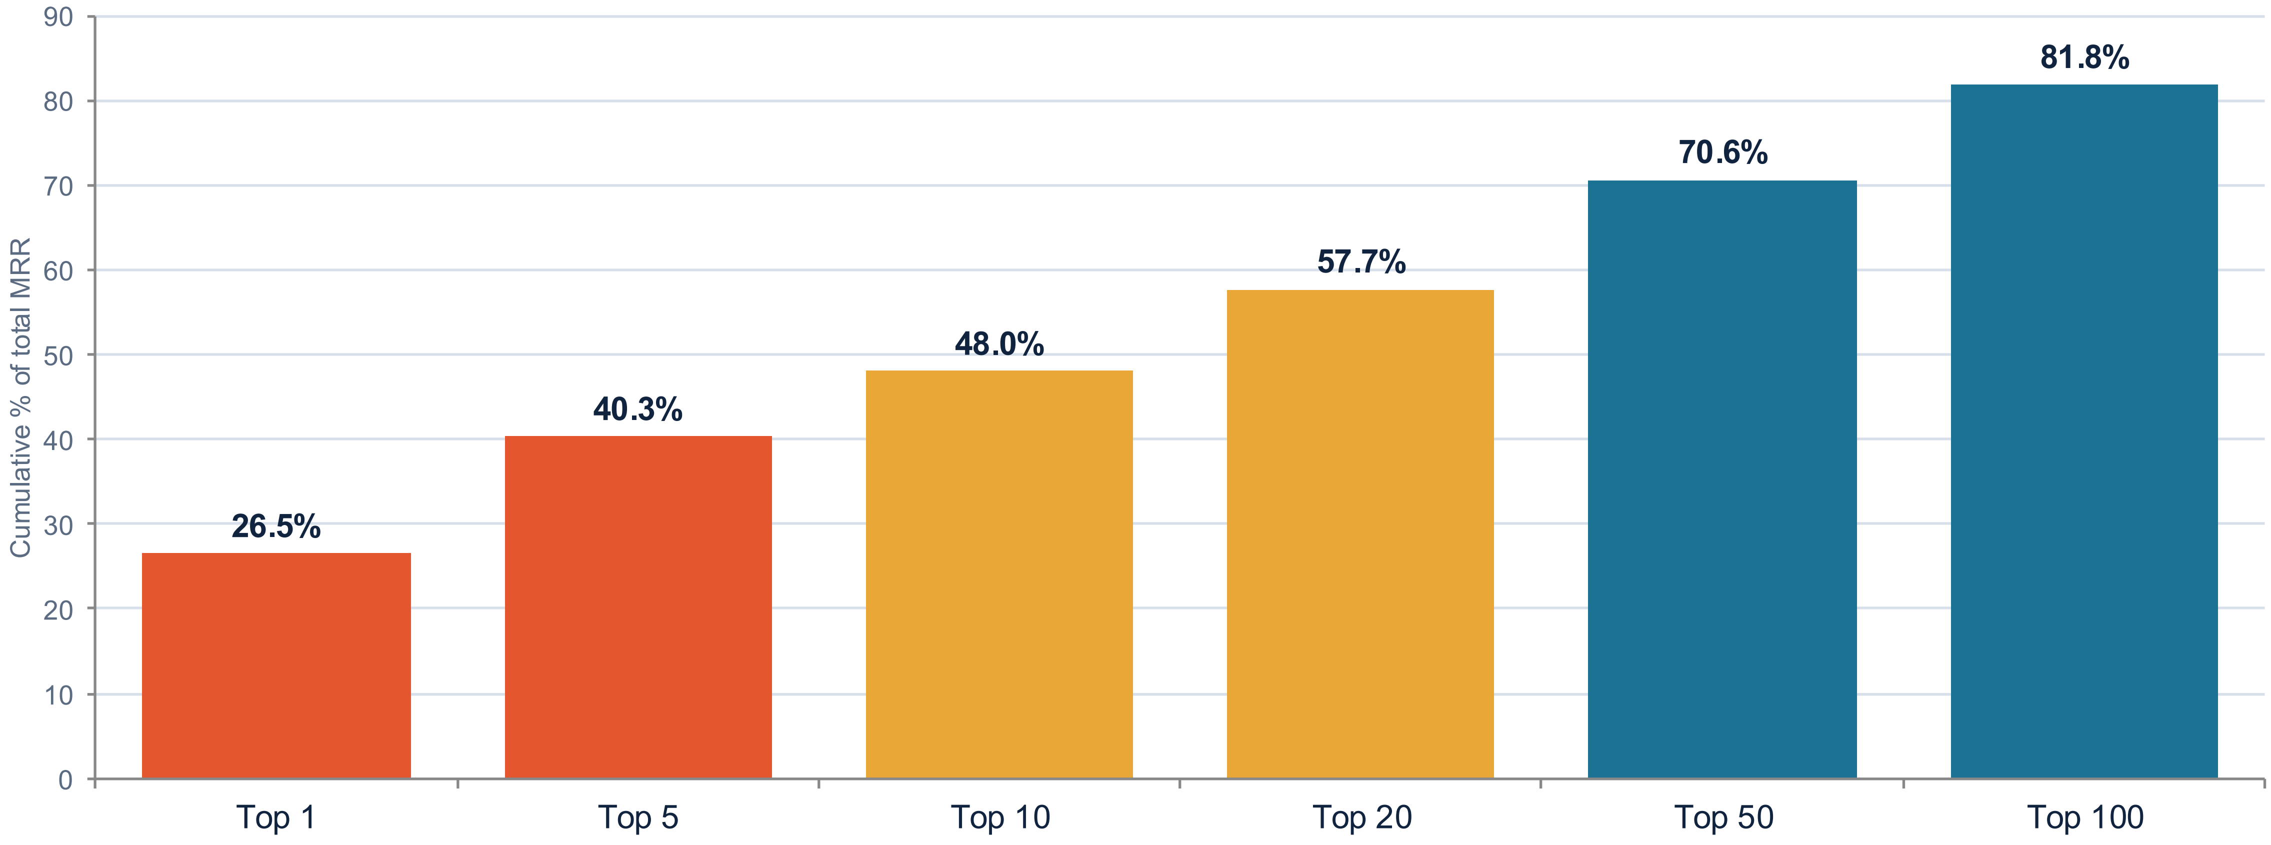
mrr_growth_30d_pct has extreme outliers (one listing shows +12,983% off a tiny base). Portfolio-level revenue is the reliable signal; company-level growth % should be trimmed before averaging.

38% of listings show zero recorded growth

381 of 1,000 companies report exactly 0% MRR growth for the period - worth checking whether that's true stagnation or a reporting gap before using it to judge product-market health.

One account is more than a quarter of total MRR

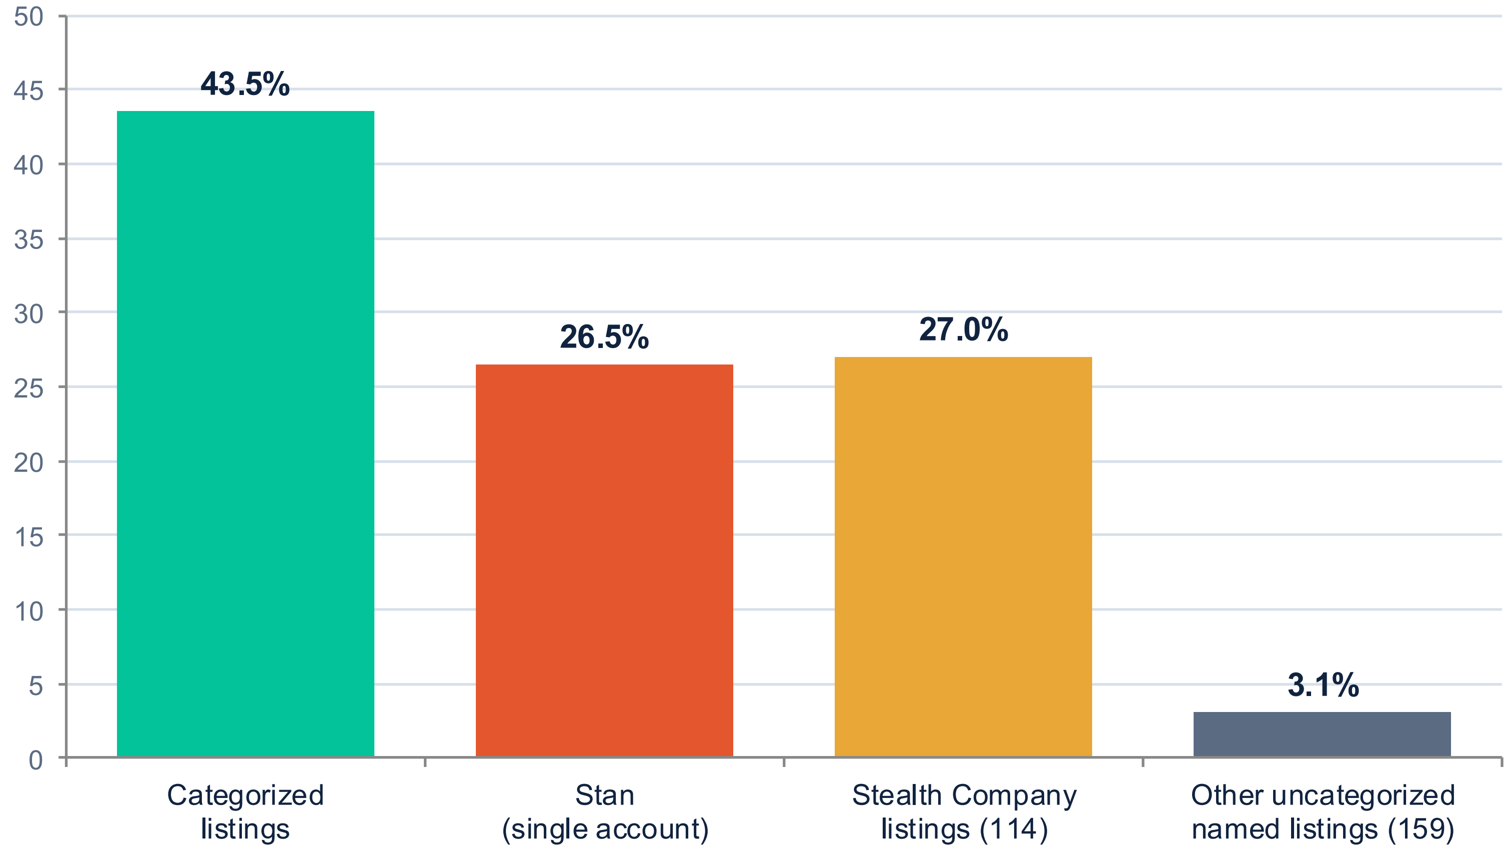
Cumulative share of MRR held by the top N accounts - concentration this steep is a single point of failure, not a diversified base.



Losing the single largest account would remove more MRR than the bottom ~800 listings combined generate today.

56% of MRR carries no category tag - every category ranking in this deck reads on the other 44%

The gap isn't random: it's dominated by the single largest account and 114 stealth-mode listings that intentionally withhold identity.



What this means

Any statement of the form "AI is the leading category" is true only among the categorized 44% - it says nothing about the largest account or the stealth cohort.

Why it's fixable

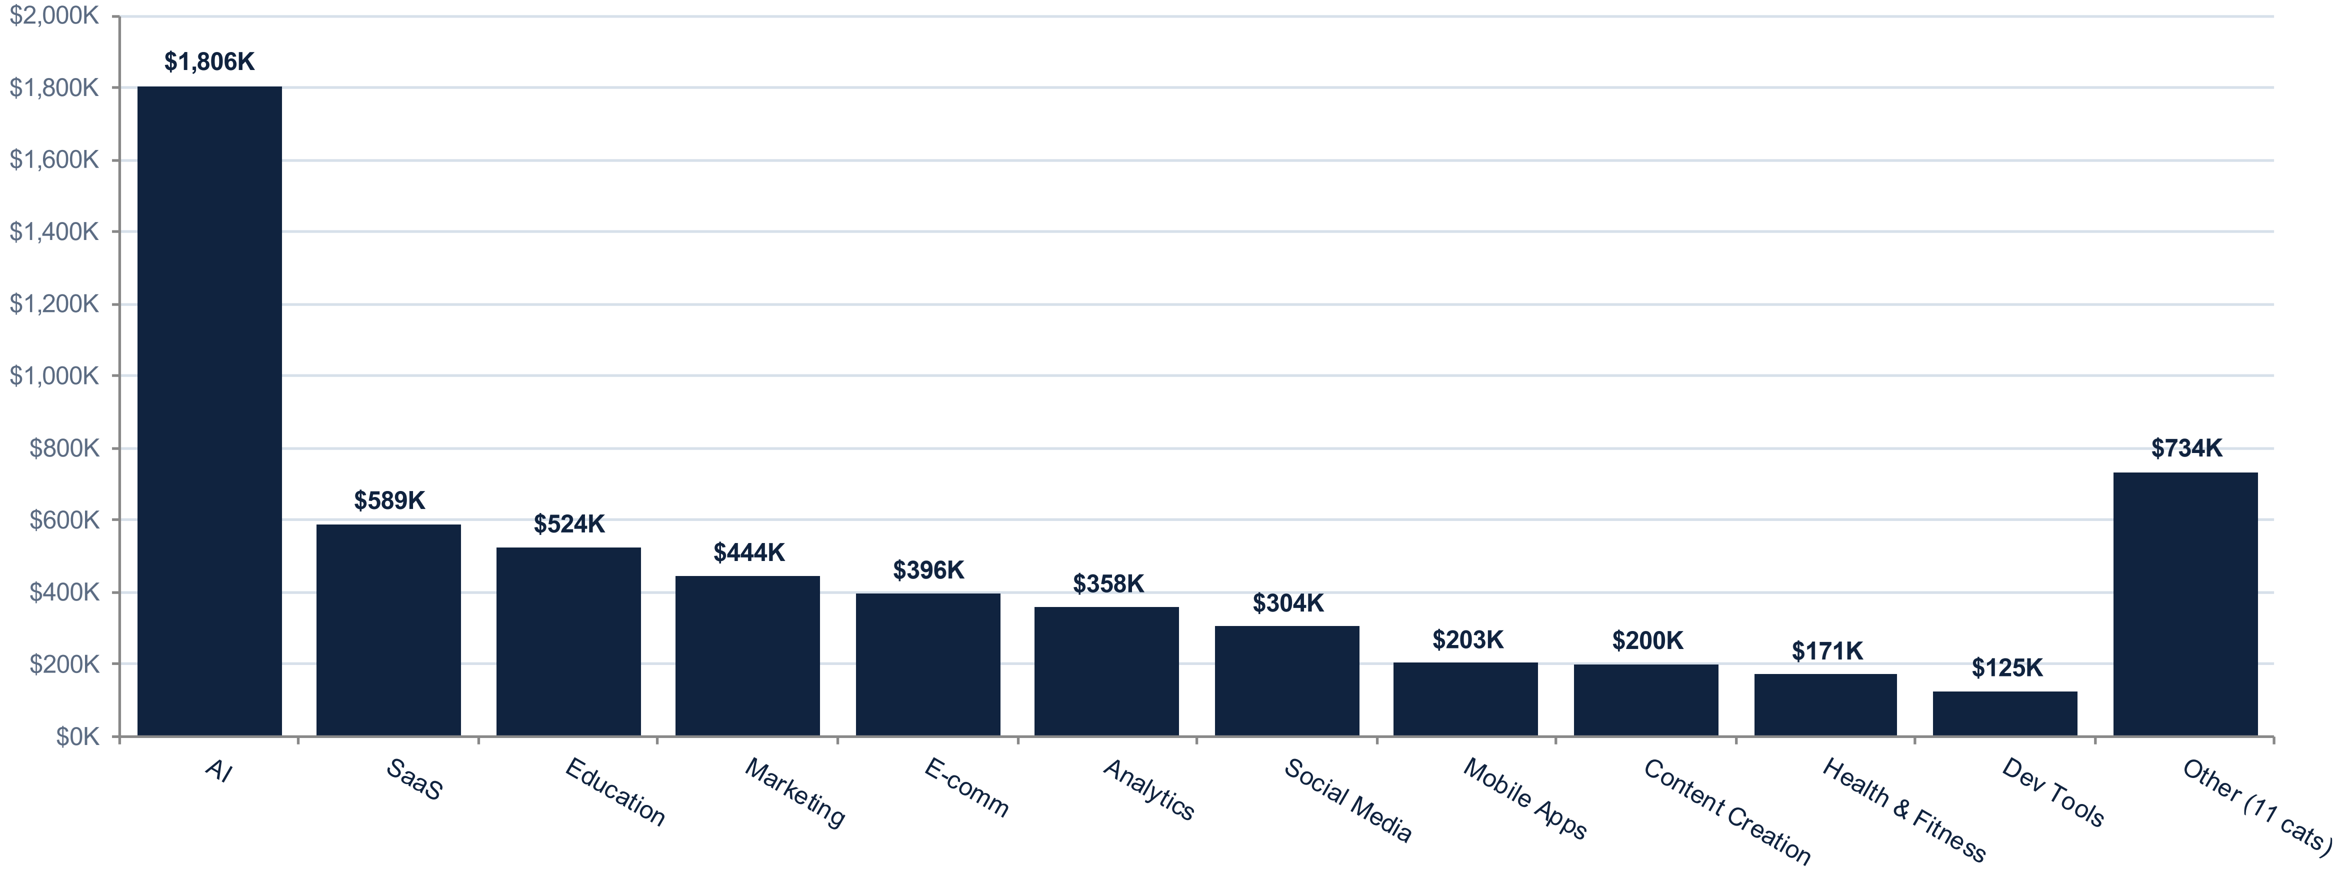
value_proposition and problem_solved text exists for most rows even without a category tag - this is a classification job, not a data-collection job.

Why it matters now

Product and pricing decisions guided by category mix today are effectively guided by a 44% sample that skews toward smaller, self-tagged listings.

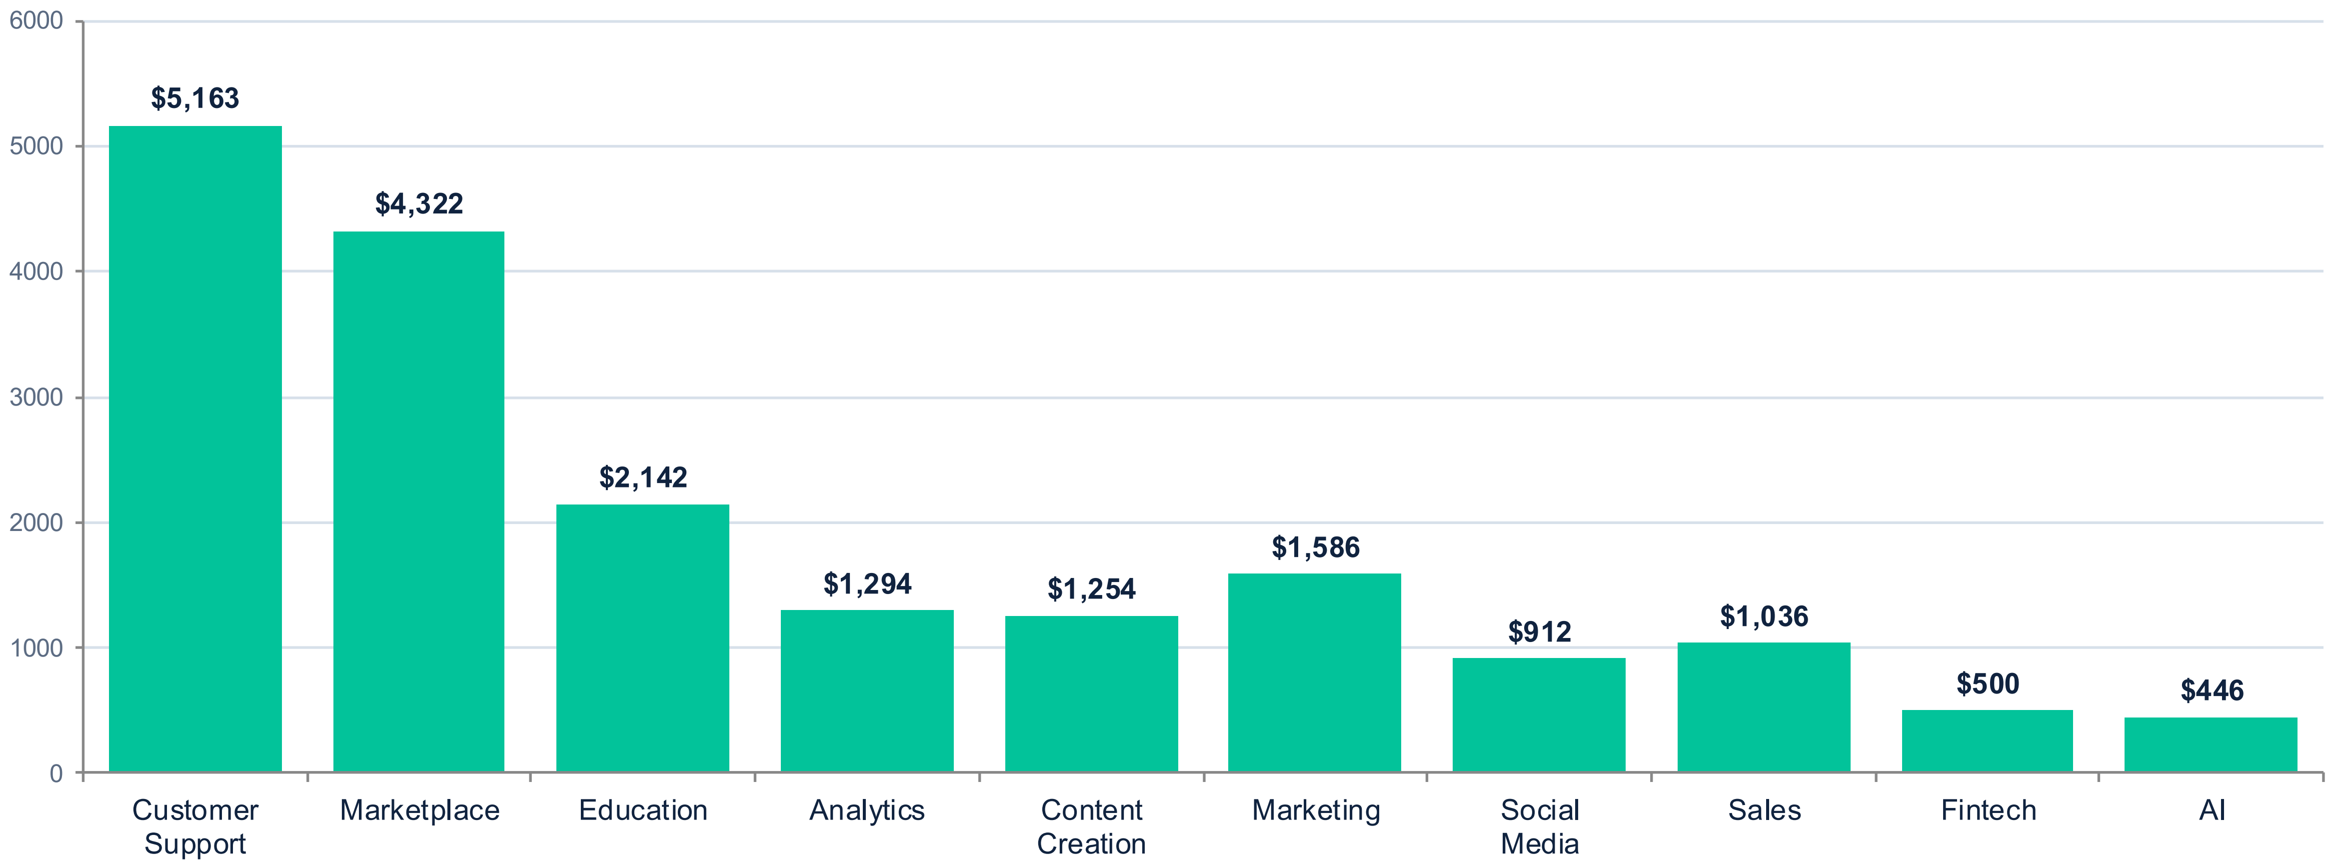
AI carries the categorized book, but the top 6 categories already explain 80% of tagged MRR

Reference only - remember this covers the categorized subset, not total portfolio MRR (see prior slide).



AI wins on total dollars; Customer Support and Marketplace win on dollars per company

Median MRR per listing - a cleaner read on which categories produce individually healthy businesses, unskewed by a few outsized accounts.

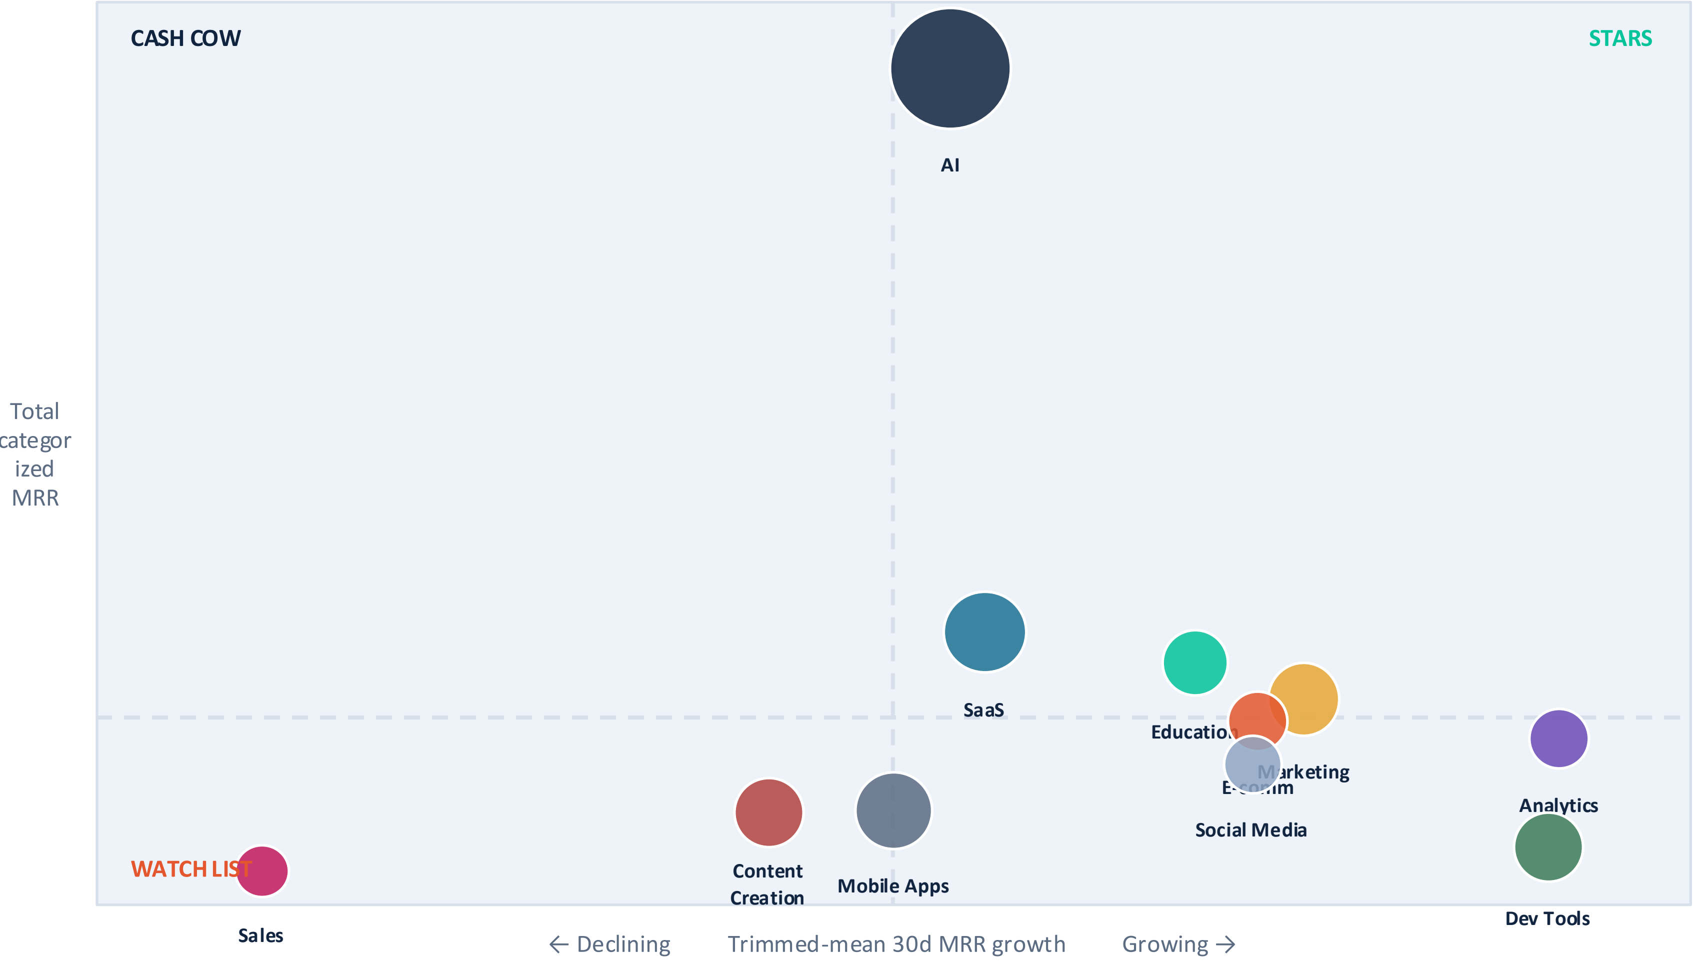


AI's median listing earns $446/mo - 12x less than the median Customer Support listing - despite AI carrying 31% of categorized total MRR.

PORTFOLIO MATRIX

Dev Tools and Analytics are the small, fast-growing categories worth watching; Content Creation is shrinking

Bubble = category; x-axis = trimmed-mean 30-day MRR growth; y-axis = total categorized MRR; bubble size = number of listings.



Stars

Analytics & Dev Tools: smaller today, growing fastest (+11-12%). Prime candidates for feature investment.

Cash cow

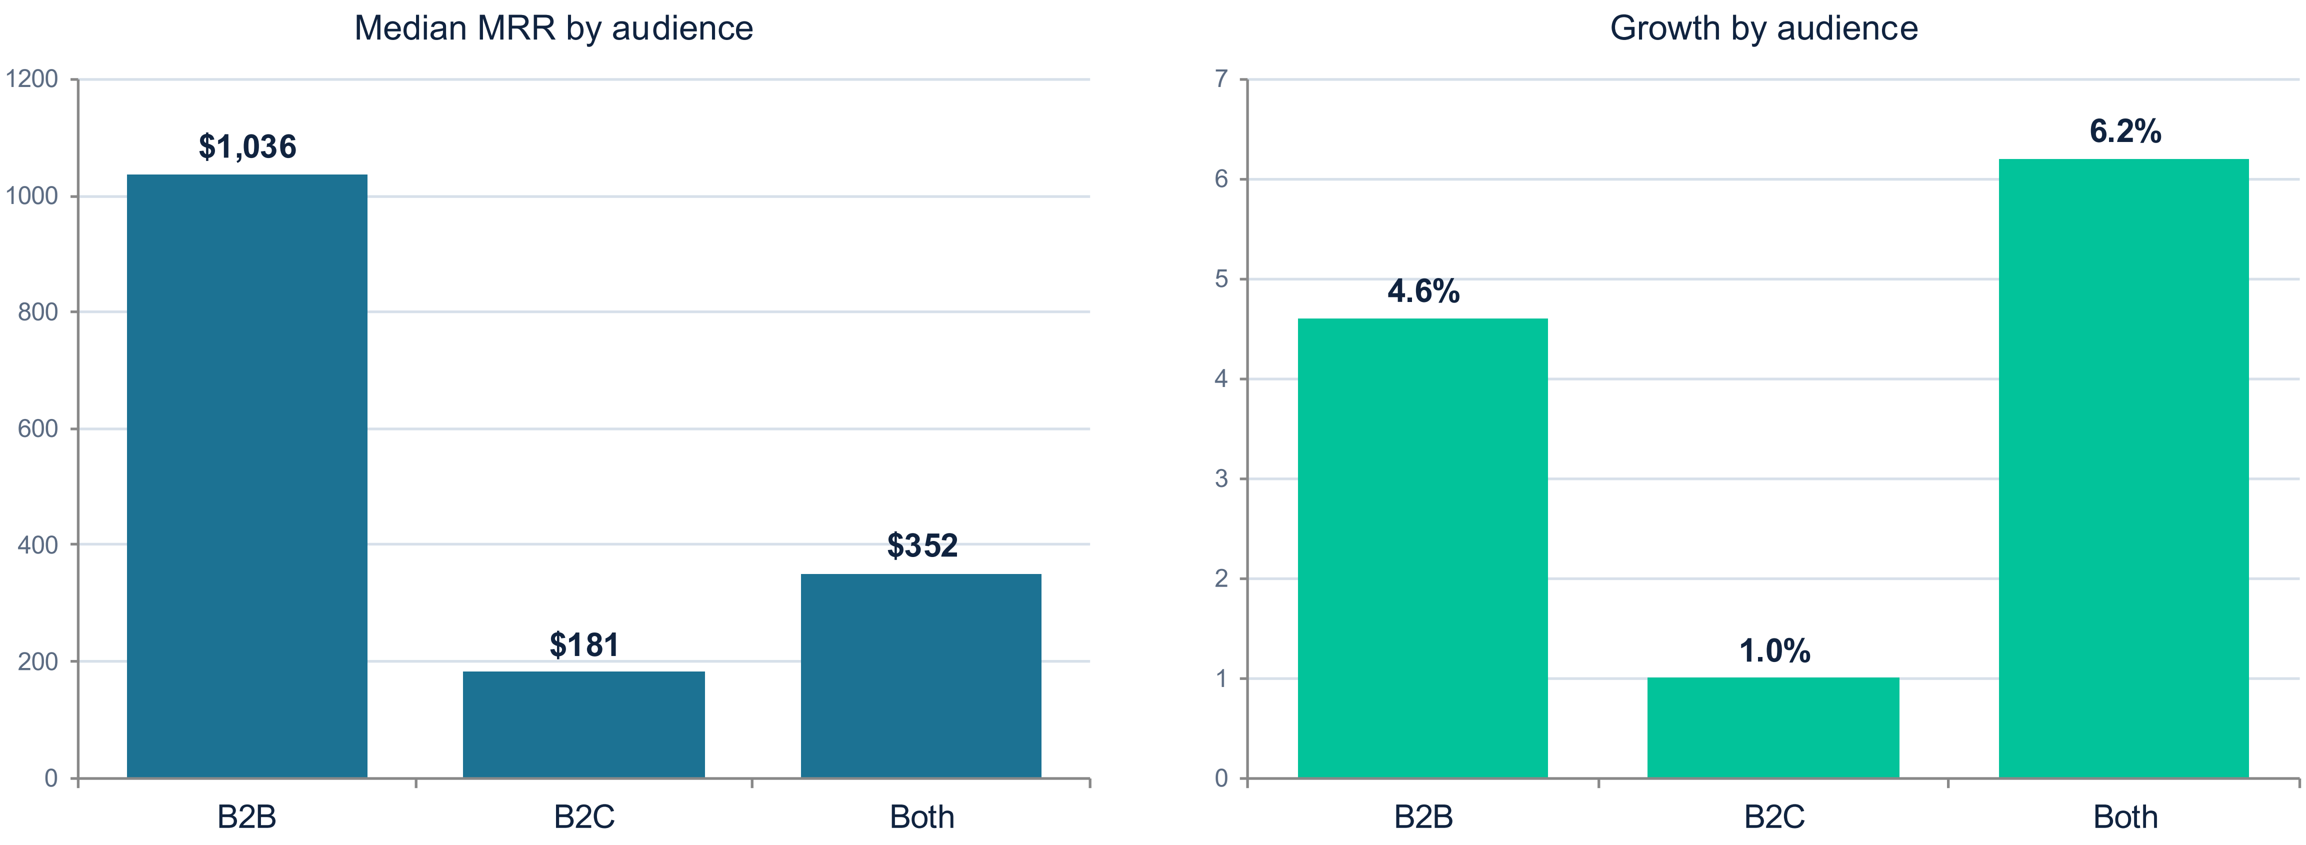
AI: dominant size, near-flat growth (+1%). Defend share; don't expect it to be the growth engine.

Watch list

Content Creation is the only sizeable category in outright decline (-2.2%).

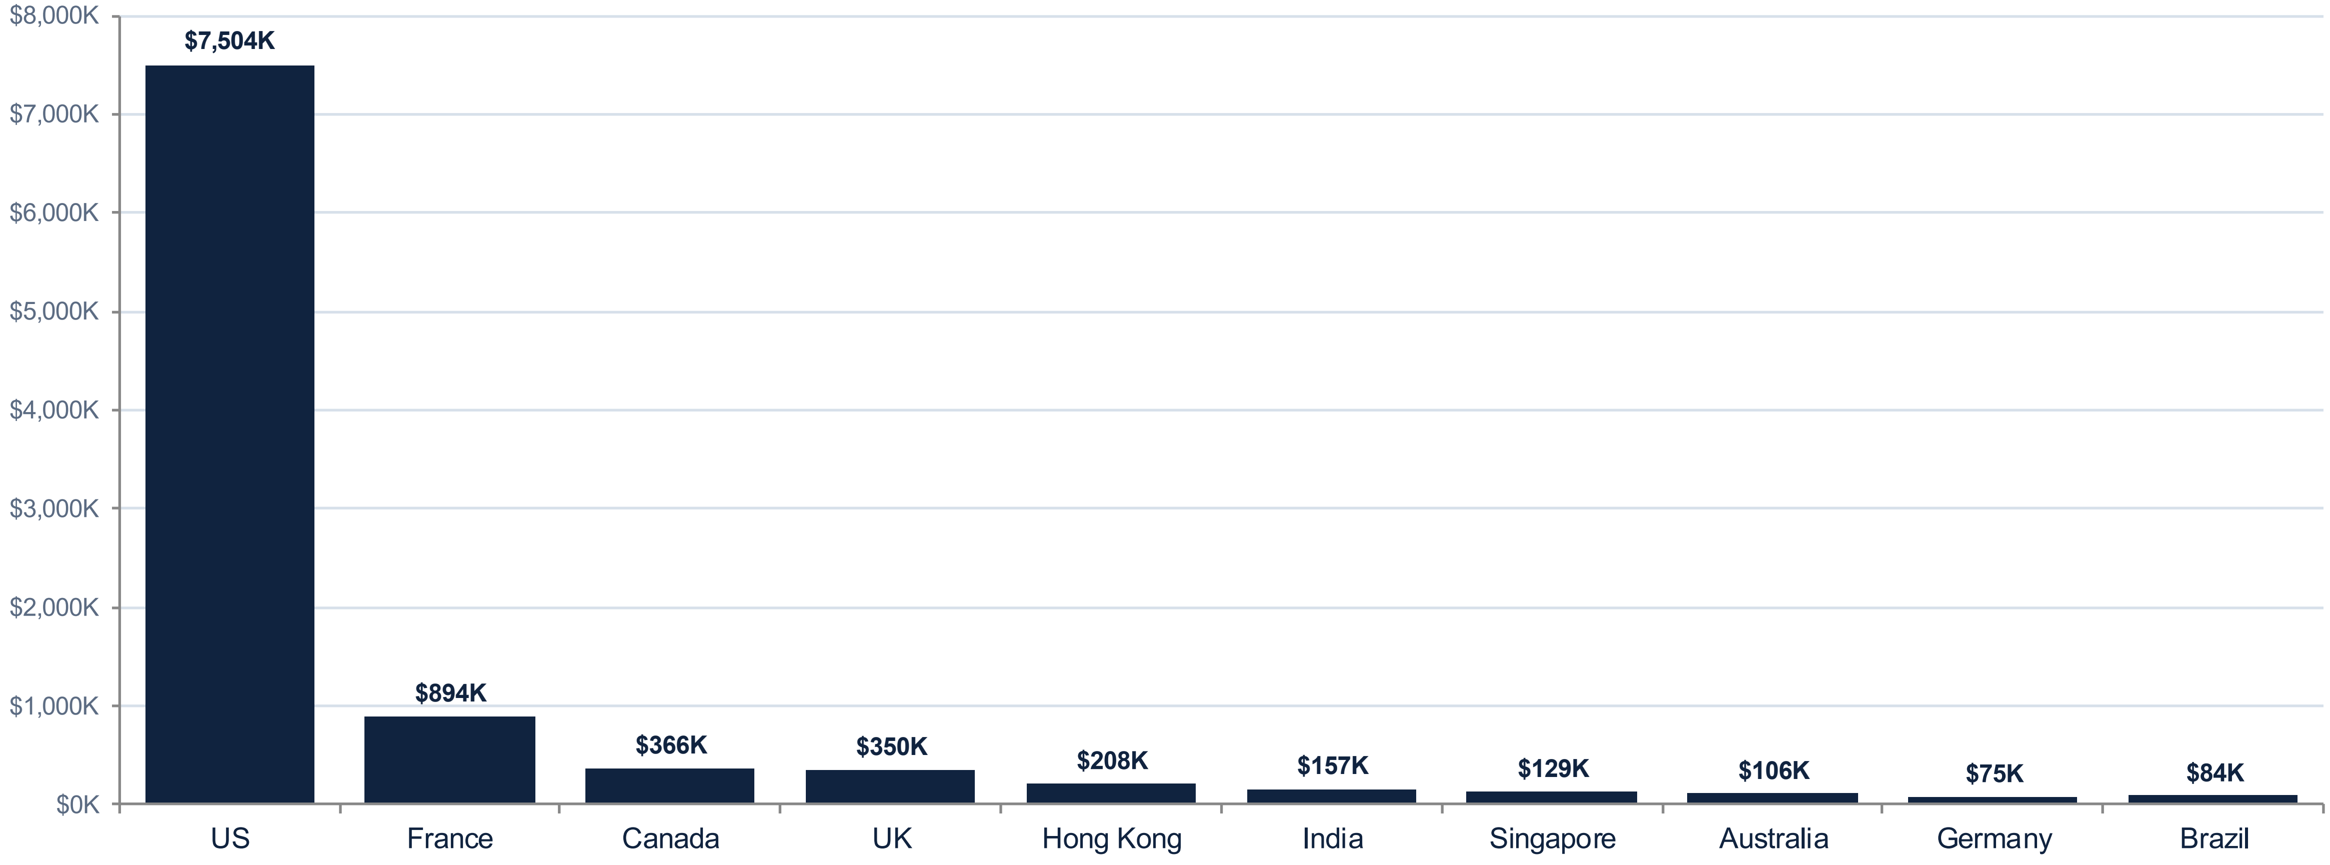
B2B is outnumbered 401-to-255 by B2C listings but delivers 5.7x the revenue per account and grows 4.5x faster

Where audience type is tagged (712 of 1,000 listings), B2B is the stronger dollar - not the bigger crowd.



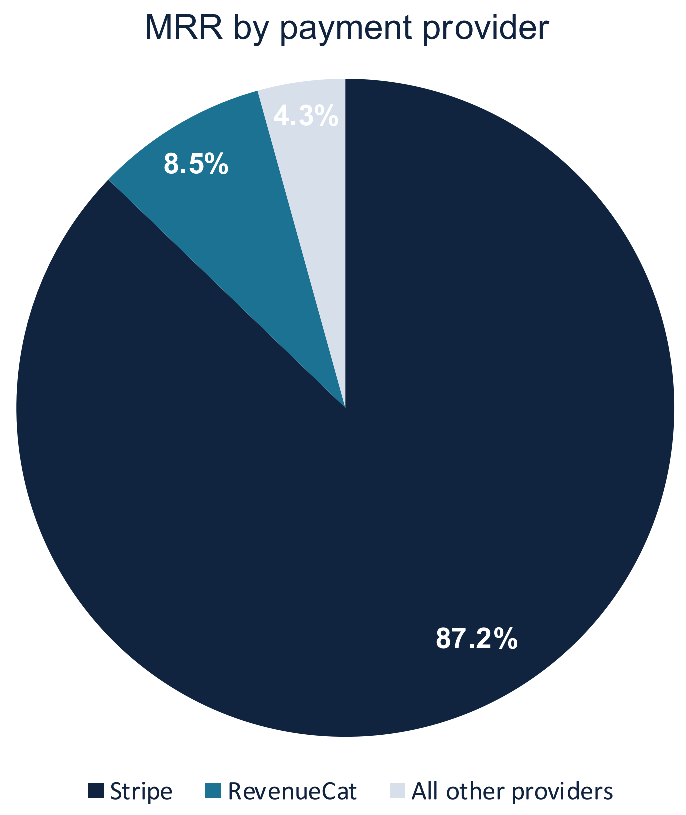
The US alone is 56% of total MRR; France is a distant but clear #2

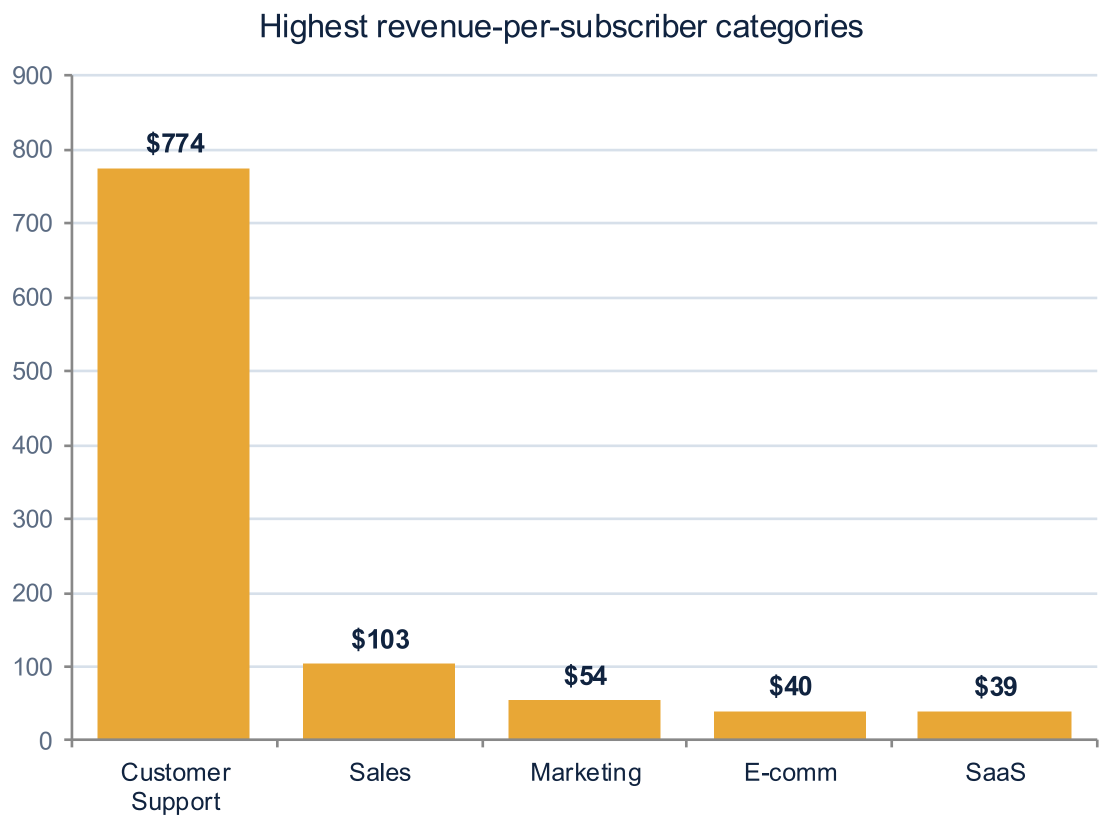
Among the 76% of listings with a recorded country - concentration mirrors the account-level pattern seen portfolio-wide.



87% of MRR runs through one payment integration - and per-subscriber revenue varies 20x by category

Two views of monetization health: platform dependency risk, and where the pricing model is actually working.





Domain authority is not a growth lever: domain_rating correlates weakly with MRR (r=0.21) and not at all with growth (r=-0.07). SEO-led investment would be a low-ROI bet based on this sample.

The highest-value categories are also the most under-supplied on the platform

Categories with strong per-account economics but very few listings - the platform is thin exactly where the model works best.

Customer Support	5 listings	**$5,163 median MRR**	Highest revenue-per-subscriber in the portfolio (7.5x the next category).
Marketplace	7 listings	**$4,322 median MRR**	Second-highest median MRR; almost no supply to court more of.
Education	30 listings	**$2,142 median MRR**	Already has scale and the best combination of size + median value.
Analytics	19 listings	**$1,294 median MRR**	Fastest trimmed-mean growth of any sizeable category (+11.7%).

Four risks compound each other: concentration, blind spots, decline, and incomplete data

None of these are catastrophic in isolation, but they stack - the biggest account is also the biggest data gap.

HIGH

Single-account concentration

Top 1 account = 26.5% of MRR; top 10 = 48%. A churn or dispute event on the #1 account is a material portfolio event.

HIGH

Category blind spot

56% of MRR is untagged. Every category-level decision made today is based on <44% visibility into the business.

MED

Declining & volatile segments

Content Creation trending negative (-2.2%); Sales (-11.1%) and Security (-9.5%) are the weakest trimmed-mean performers among sizeable categories.

MED

Payment infrastructure concentration

87% of MRR depends on one processor (Stripe). Fine operationally today, but a single point of platform risk as international mix grows.

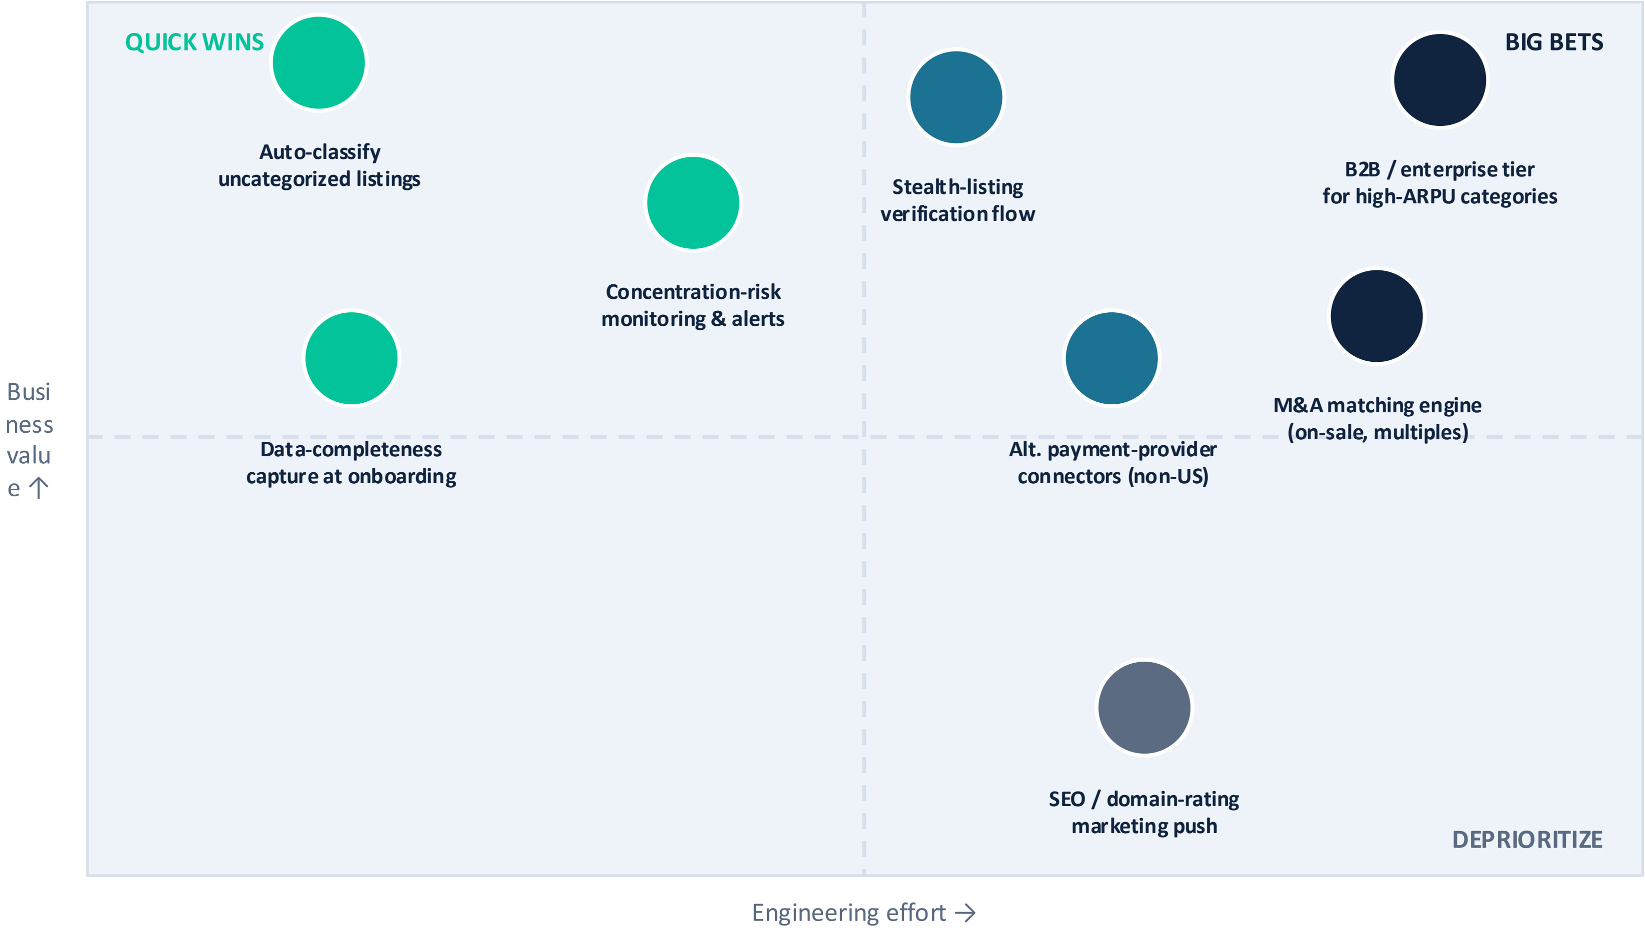
LOW

Broad data incompleteness

Country (24%), audience type (29%), pricing model (34%), and domain rating (29%) are all missing on a material share of listings - limits confidence in every cut in this deck.

Fix the category blind spot and concentration monitoring first - both are high-impact, low-to-medium effort

Engineering value vs. effort for the initiatives implied by this analysis. Effort is a directional estimate, not an engineering estimate - flag for sizing before roadmap commitment.



Do first

Auto-classification and concentration monitoring both address the two HIGH risks flagged on the prior slide, and both are largely data/logic work - not new infrastructure.

Sequence next

Stealth-listing verification and alt-payment connectors unlock international and trust gains but need product design work, not just engineering.

Fund deliberately

B2B tiering and the M&A matching engine are the highest ceiling but multi-quarter builds - scope as deliberate bets, not quick sprints.

KEY RECOMMENDATIONS

What Leadership Should Do Next

Immediate (0–4 weeks)

- Stand up concentration-risk monitoring on the top 10 accounts
- Kick off auto-classification of the 274 uncategorized listings
- Audit and disclose data-completeness gaps to teams using category reports

Near-term (1–2 quarters)

- Build a stealth-listing identity/verification flow
- Add 2–3 alt-payment connectors for non-US markets
- Launch onboarding prompts to close audience-type & pricing-model gaps

Long-term (2+ quarters)

- Design a B2B / enterprise tier for high-ARPU categories
- Invest in the M&A matching engine for the on-sale segment
- Re-evaluate SEO/domain-authority spend given weak correlation to growth
