SESSION 3 · TRUSTMRR DATASET · FROZEN 30 JUL 2026

1,000 startups.
One very uneven market.

What the revenue, the growth, the price tags and the missing cells actually say about the indie software economy.

$15.6M
reported 30-day revenue

$400
median monthly revenue

26%
of listings are for sale

31%
grew by exactly zero

Anushka Kothari |AI in Business

The average listing does not exist

Ten companies out of a thousand carry half the revenue on the platform. The single largest earns more in 30 days than the bottom 750 combined, so any “average startup” figure describes nobody.

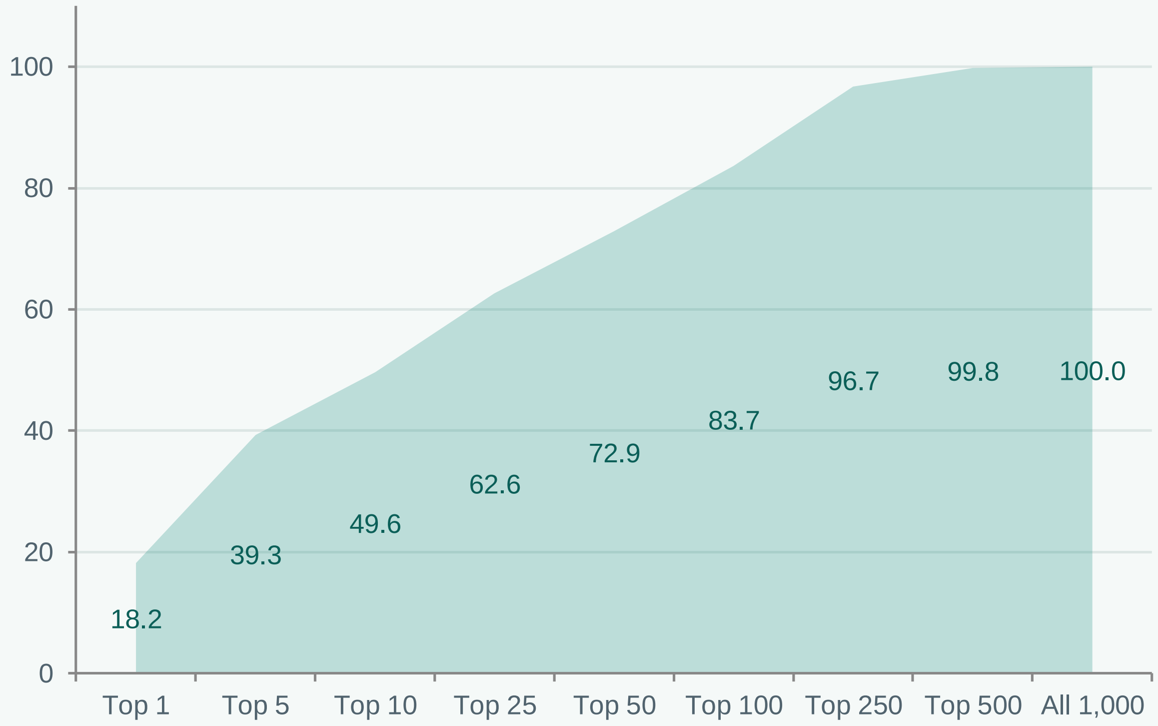
18.2%
of all revenue sits with one company

49.6%
is held by the top 10 listings

Mean $15,596 vs median $400

A 39x gap. 216 listings reported exactly zero revenue this month.

Cumulative share of 30-day revenue (%)

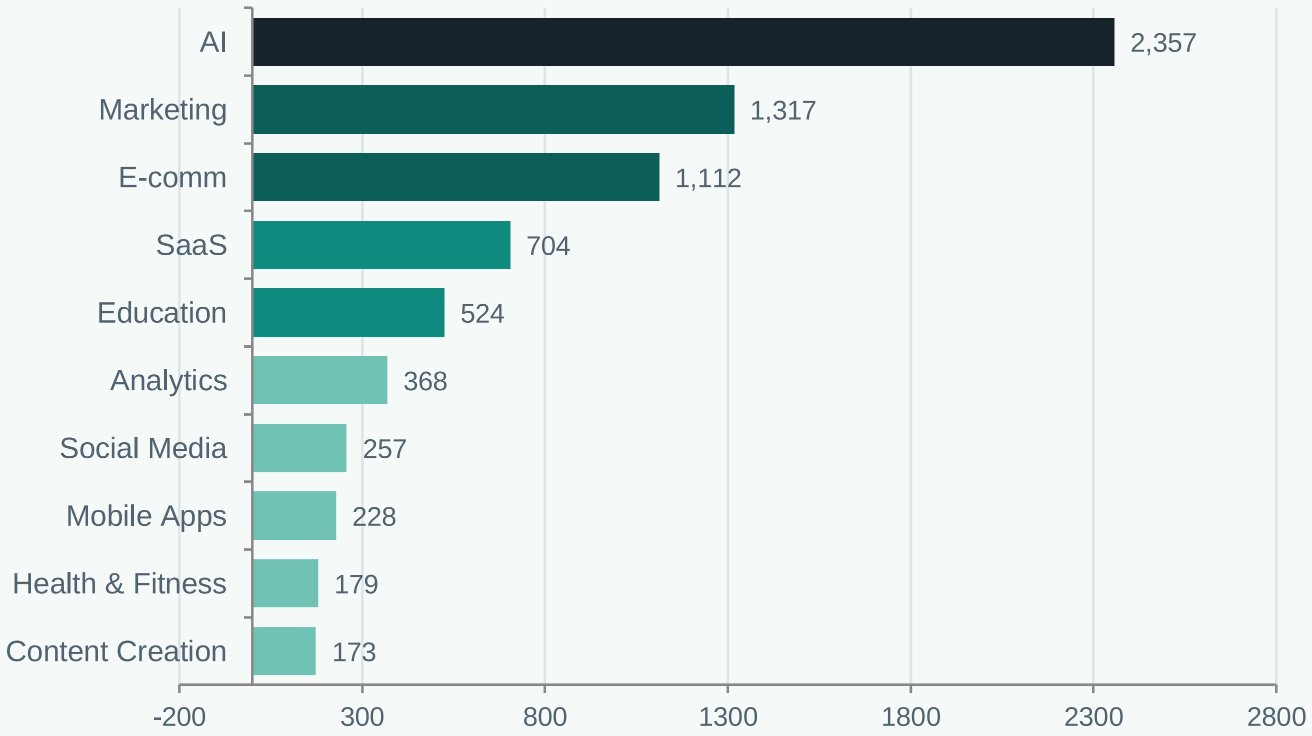


WHERE THE VALUE SITS

Volume and value live in different places

AI is the crowd. Marketing and E-comm are the money.

Total 30-day revenue by category ($000s)



AI
197 listings · 15% of revenue

Most crowded, thinnest per head. Median MRR $446.

Marketing
42 listings · 8% of revenue

Highest median MRR of the large categories at $1,586.

E-comm
19 listings · 7% of revenue

One listing supplies 89% of it. Median MRR is $155.

Geography
US = 63% of revenue

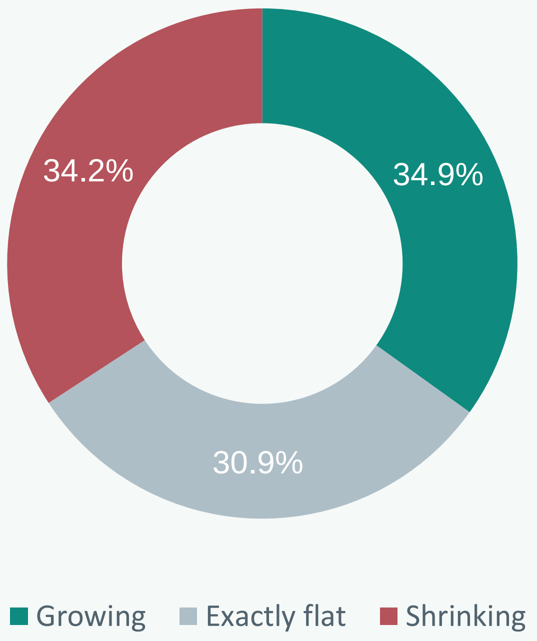
From 26% of listings. France leads volume outside the US.

MOMENTUM

Two thirds of this market is not growing

Month-on-month revenue change splits almost perfectly into thirds, and the largest single value in the column is zero.

Share of listings by 30-day revenue growth (%)



305 — **listings reported exactly 0% change**

The modal startup here is standing perfectly still.

30 — **listings fell to −100%**

Revenue went to zero in a single month.

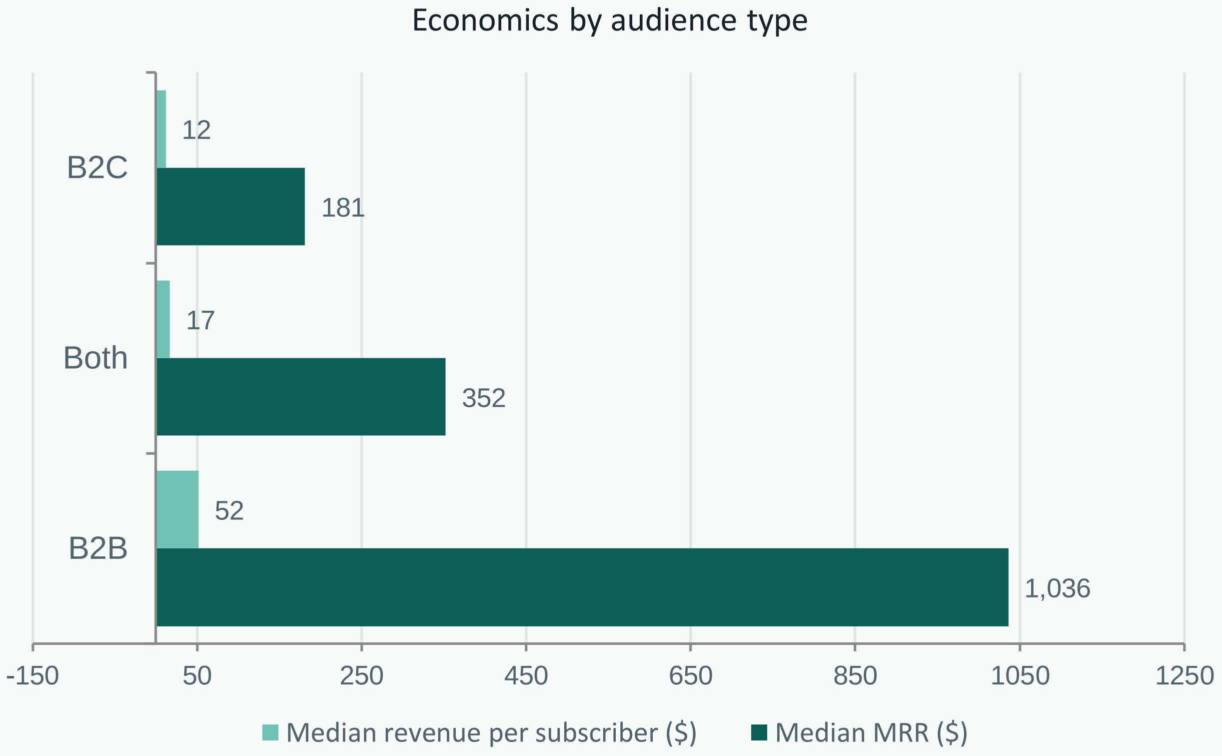
66 — **listings more than doubled**

The upside is real but rare: 6.6% of the market.

FOUNDER BENCHMARKS

B2B earns five times more per listing than B2C

Most founders on the platform build for consumers. The economics reward the opposite choice.



401 vs 255

B2C listings outnumber B2B by 57%, yet B2B produces $5.77M of 30-day revenue against B2C's $2.29M.

What actually predicts revenue

Active subscriptions	0.80
Domain rating (SEO)	0.28
X / Twitter followers	0.02

Correlation with 30-day revenue. Audience size is not distribution.

$86.8M of asking prices, loosely attached to reality

262 listings are for sale. Their stated multiples barely move with the revenue they report, which makes the sticker price a negotiating position rather than a valuation.

262

listings for sale
26% of the platform

$35,000

median asking price
mean is $331,218

2.3x

median stated
revenue multiple

4.3x

median for B2B+B2C
vs 2.3x single-audience

The number that should stop a buyer

- Stated multiple vs. the multiple implied by asking price ÷ 12-month revenue correlates at −0.01 across 245 priced listings. Effectively no relationship.
- 16 listings are on sale with zero recorded 12-month revenue, at a median ask of $4,000.
- Multiples run from 0x to 326x, so the mean of 7.8x is meaningless.

So what

Price off the 225 sellers with real MRR, where the median is 2.6x on a $50,000 ask. Treat every listed multiple as a claim to be re-derived, not a fact.

WHAT THE DATASET HIDES

Every conclusion here rests on three quarters of a table

82%	27%	24%	13%
missing visitor counts	missing category	missing country	anonymous sellers

The gaps are not random. The 130 anonymous listings hold $4.19M, 27% of all revenue, and the 392 sparsely filled records out-earn the 608 well-documented ones. Disclosure falls as revenue rises, so filtering for clean rows quietly deletes the top of the market.

1

Read it in medians

Means are hostage to one $2.8M outlier. Median MRR is $400 and 22% of listings earn nothing.

2

Sell to businesses

B2B median MRR is $1,036 against B2C's $181, on 36% fewer listings.

3

Re-underwrite every price

Stated multiples are uncorrelated with reported revenue. Rebuild them from revenue_12m.
