

AI/SaaS Marketplace: Market Snapshot

Internal analysis of 739 live listings — market composition, growth patterns, and the stealth company anomaly. Single snapshot: 30 Jul 2026.

INTERNAL USE · ANALYST AUDIENCE

The Stealth Advantage

The single most surprising finding in the dataset: anonymized listings punch far above their weight.

14.6%

Share of All Listings

Stealth Company entries —
anonymized, undisclosed names

42.5%

Top-Decile MRR Share

Stealth listings captured nearly half
of all top earner slots

15x

Median MRR Premium

\$10,694 (stealth) vs. \$699 (named)
— a 15x gap in median revenue

- Stealth listings are a disproportionate signal of platform quality — the data strongly favors anonymous sellers.

Market at a Glance

Mean is **16× higher** than median — a textbook power-law distribution driven by a handful of high-MRR outliers.

Platform Composition

- **739 listings** analyzed (not 1,000 as filename implies)
- Top decile holds **78.2%** of all platform MRR — extreme concentration
- Median MRR: **\$1,119** · Mean MRR: **\$17,630**

Geography

- 🇺🇸 United States: **41%**
- 🇫🇷 France: **11%**
- 🇬🇧 United Kingdom: **6.8%**
- Undisclosed: **36%**

Growth Reality Check

What the Numbers Say

- **30.6%** shrinking — active revenue decline
- **34.5%** flat — zero net movement
- **~35%** genuinely growing

The Skew Problem

- Median growth: **0%**
- Mean growth: **+38.8%**
- A few breakout performers mask a stagnant majority

This is a **stabilize-and-exit** marketplace, not a hypergrowth ecosystem. Most sellers are looking for a clean out.

How We Define Winners & Strugglers

Before comparing performance extremes, here is the exact segmentation used throughout this analysis.

Winners — Top Decile

Highest **10%** of listings by MRR. Median revenue **\$10,694+/month** with strong, active subscription bases. These are the platform's revenue engines.

Strugglers — Bottom Decile

Lowest **10%** by MRR. Median under **\$100/month** with near-zero subscriptions. Often listed for sale precisely because organic growth has stalled.

The Gap

Winners grow **29× faster** and carry **4,700× more** active subscriptions than strugglers. The distribution is not gradual — it is a cliff.

Winners vs. Strugglers

Top Decile • Winners

- Avg growth: **+197%**
- Active subscriptions: **4,291**
- Compound momentum — each subscriber reinforces the next

Bottom Decile • Strugglers

- Avg growth: **+6.8%**
- Active subscriptions: **0.9**
- Effectively no recurring customer base to build from

Winners compound ~29× faster. Subscription count — not MRR alone — is the leading indicator that separates the two groups.

Top Performers: Named Examples

Three named listings that illustrate the ceiling of what this marketplace produces — and what buyers are paying for.

Company	Country	MRR	Growth	Note
GojiberryAI	 US	\$494,668	+23.6%	18,050 followers
Cometly	 US	\$207,616	—	High MRR benchmark
1Lookup	 US	\$207,064	—	Listed at \$10M (2.1× ARR)

All three are US-based — consistent with the 41% US share. 1Lookup's 2.1× revenue multiple at \$10M asking price is notably conservative relative to platform averages.

The Sale Market

Mean is **6× the median** — a small cluster of high-value listings inflates the average dramatically.

Sale Market Overview

- **208 of 739 listings** (28.1%) actively for sale
- Median ask: **\$65,000** — most sellers target a quick, clean exit
- Mean ask: **\$395,700** — dragged up by rare \$1M+ outliers

Market Character

- The modal seller wants **sub-\$100K liquidity**, not a strategic acquisition process
- \$1M+ deals exist but are statistical outliers, not the norm
- Buyers should not anchor on mean price when sourcing deal flow

Valuation Multiples: Handle with Care

Median Multiple: 2.9×

The central tendency — most defensible anchor for valuation benchmarking. Use this as the baseline before any adjustments.

Mean Multiple: 8.82× — *Badly Skewed*

Inflated by extreme outliers in the 60×–327× range. These are near-zero-MRR listings where any positive MRR creates an astronomical multiple. **Noise, not signal.**

Trimmed Mean (Top 5% Removed): 4.15×

Cleaner, but still inflated by small-MRR listings in the dataset. Recommend applying an MRR floor before using any multiple-based valuation — see next card.

Key Caveats

Before sharing or acting on this analysis, analysts should internalize these data quality constraints.

Row Count Mismatch

739 rows analyzed — not 1,000 as the filename suggests. Confirm the correct universe before any external sharing or follow-on analysis.

Self-Reported Metrics Only

All MRR, growth, and subscription figures are seller-provided. **No independent verification** exists. Treat all figures as directional, not audited.

Disclosure Bias

36% undisclosed country, **15%** undisclosed name. Stealth listings demonstrably outperform — meaning high performers are systematically underrepresented in the named dataset.

Single Snapshot

Data captured **30 Jul 2026** only. Growth trajectories and sale status are already aging. Do not treat this as a live or rolling dataset.

Strategic Questions

Three open questions this dataset raises for the sourcing and evaluation workflow — ranked by urgency.

1 Shift Sourcing Toward Direct Outreach?

Stealth listings outperform named listings by 15× on median MRR and hold 42.5% of top-decile slots. Should the team prioritize **direct seller outreach to anonymous operators** rather than relying on public listing discovery?

2 Define a Pre-Screening Threshold

What minimum growth rate and active subscription count should filter the pipeline **before human review**? The current dataset suggests sub-10-subscriber listings rarely justify analyst time regardless of asking price.

3 Apply an MRR Floor to Valuation Models

Should we enforce a **minimum MRR (e.g., \$1,000+/month)** before applying any revenue-multiple valuation? The 60×–327× outliers are all near-zero-MRR listings — an MRR floor would eliminate the noise cleanly.
