

The Stealth Economy

129 companies in this dataset chose not to say who they are. They also happen to be some of its biggest earners.

12.9%

of all listings in this dataset are unidentified — no name, no website, often no category or country.

Each square = 10 companies. Red = anonymous "Stealth Company" listings.

They're not hiding because they're small.

Median performance, identified vs. anonymous listings

Median Monthly Revenue (MRR)

Median Active Subscriptions

40× the MRR. 22× the subscribers. Stealth listings are 12.9% of the dataset by count — but hold 16.5% of all its revenue.

It's not just their name. They hide everything.

Share of companies that publicly disclose each field

THE FEW WHO SLIP

Of the 129 stealth listings, only 15 reveal an industry at all. Those 15 are scattered across 9 different categories — Utilities, Health & Fitness, Education, AI, Dev Tools, and more.

No single industry is systematically going quiet. Whatever's driving this, it isn't a category-specific instinct.

You'd think they're just staying quiet before a sale.

The data says no.

26.5% $\approx$ 24.0%

A nearly identical share of both groups is on the market right now.

If secrecy were about prepping for an exit, stealth listings should show up “for sale” far more often than named ones. They don't — the gap is within noise.

THEORY: RULED OUT

The pattern isn't industry. It isn't geography. It isn't an exit.

It's just size — the more a company earns, the more likely it is to disappear from view.
