

KEY INSIGHTS

What 1,000 Startups Reveal

A data-driven read on where revenue, growth, and category crowding actually sit across the TrustMRR startup dataset — and what it implies for where to build, compete, or buy.

1,000 STARTUPS • 90+ COUNTRIES • 30-DAY REVENUE SNAPSHOT

Revenue Is a Power Law, Not a Bell Curve

A tiny sliver of startups — and one country — account for most of the money moving through this dataset.

Startup Count Share vs. Revenue Share, by Tier

49.6%

of all 30-day revenue in the dataset comes from just the top 10 startups (~\$7.7M of \$15.6M total)

21.6%

of startups (216 of 1,000) generated \$0 in revenue over the last 30 days — the median startup earns just \$400/mo

US = 26% of startups, 63% of revenue

The US is 2.4x overrepresented in revenue relative to its share of startups — France and India, the #2 and #3 markets by count, together generate under 6% of revenue.

The Most Crowded Category Isn't the Most Lucrative

AI has by far the most startups — but per-startup earnings tell a very different story.

197

AI startups in the dataset — nearly 1 in 5 of all 1,000, and 4.7x the size of the next-largest category (SaaS, 66)

\$503

AI's own median monthly revenue — lower than Education, Marketing, Content Creation and Social Media, each with far less competition

Median 30-Day Revenue by Category (# of startups)

What Separates Winners: Buyer Type & Payment Maturity

Two structural signals correlate strongly with real, collectable revenue — and a resale market has formed around this data.

Median 30-Day Revenue by Buyer Type

B2B startups earn ~4x more than B2C at the median — despite being outnumbered by B2C startups in the dataset.

Share of Startups with \$0 Revenue, by Payment Stack

Startups on Stripe or RevenueCat are far less likely to show \$0 revenue than those on newer processors like Polar or Lemon Squeezy — a useful proxy for stage/maturity.

262 startups (26%) are listed for sale

at a median asking price of \$35,000 and 2.3x trailing revenue — but multiples swing from 0x to 300x+, so headline multiples alone are unreliable without checking absolute revenue first.

Domain Authority Is the Sharpest Revenue Signal in the Data

Median revenue climbs in an almost perfect staircase as Ahrefs Domain Rating rises — no other single field in the dataset predicts revenue this cleanly.

Median 30-Day Revenue by Domain Rating Band (# of startups)

B2B Customers Pay 5x More Per Subscriber Than B2C

Looking at revenue per active subscriber (not just company totals) confirms B2B monetizes each customer far more efficiently.

Median Revenue per Active Subscriber (ARPU)

\$49 vs \$9.34

Median monthly ARPU: B2B startups extract ~5.2x more revenue per paying subscriber than B2C — a much bigger gap than the ~4x seen at the whole-company level.

48 startups

earn revenue with zero active subscriptions — i.e. one-time purchases rather than recurring billing. Together they contribute under 1% of total dataset revenue, confirming this data is overwhelmingly a subscription-revenue sample.

Nearly Half the Dataset Is Running Hotter Than Its Own Yearly Pace

Comparing each startup's current run-rate (last 30 days, annualized) to its trailing 12-month revenue shows a market still tilted toward growth.

Momentum Split — 891 Startups with Full Revenue History

Beyond the US: A Long, Thin Geographic Tail

The dataset spans 65 countries, but real revenue outside the US is concentrated in a handful of secondary hubs.

Total 30-Day Revenue, US vs. Next 7 Countries

65

countries are represented in the dataset — genuinely global reach

22 of 65

countries (34%) have just a single startup in the dataset — the geographic tail is extremely thin past the top ~15 markets
