

TRUSTMRR · 1,000 VERIFIED STARTUPS · DATASET FROZEN 30 JULY 2026

Where should you build?

Nobody in this dataset is guessing about their revenue — a payment provider reported it. So instead of asking which ideas sound good, we can ask a harder question: which spaces actually pay.

1,000

startups

\$15.6M

revenue, last 30 days

65

countries

262

up for sale

A database of receipts

TrustMRR asks founders to connect a read-only key from their payment provider, then publishes what the money rails report. It has since grown a second half: a marketplace where those same founders sell the business.

ONE ROW, UNPACKED — STACK INFLUENCE, THE THIRD-BIGGEST EARNER IN THE FILE						
Revenue, 30 days	MRR	Paying subscribers	X followers	Domain rating	Sells to	Category
\$868,322	\$25,703	55	900	70	B2B	Marketing
Problem solved "Simplifying and automating the process of influencer collaborations at scale"						

What it is good for. Almost every startup dataset is self-reported funding or valuation. This one is bank-rail revenue for a thousand companies — and the price a quarter of them will accept to walk away.

What it hides. Verified revenue is not profit. It says nothing about churn, refunds, ad spend or how many hours a week the founder works to hold it up.

Who is in it. Listing is voluntary, so this is the population of founders who *want* their numbers seen. Read every finding as "among founders confident enough to publish".

Ten companies hold half the money

Revenue here is not distributed — it is concentrated. The bottom 500 startups, put together, account for two-tenths of one percent of it.

The realistic prize is \$2,000 a month

Four in ten of these startups earn under \$100 a month. One in five earns nothing at all. Plan against that, not against the headline.

n = 1,000 · startups by 30-day revenue band

332

startups clear \$2,000 MRR — the line where a solo founder can live on it

1 in 3

is the honest success rate among people who got far enough to publish their revenue at all

Only 20 of the thousand cross \$100,000 a month. Choosing where to build is the highest-leverage decision on this list — and it is made before a line of code.

The ten biggest audiences, and what they actually earn

If reach converted to revenue, these two dots would move together. They do not.

n = 984 startups with a follower count · each row scaled against the largest value in its own column

Three of the top four are one person. TrustMRR, DataFast and Stalkr all show ~366,000 followers because the field tracks the founder's account, not the product's.

Two of the ten earn nothing. Stalkr and one anonymised listing booked \$0 last month. Niche Traffic Kit has 131,000 followers and \$914.

One dot per startup. There is no line here.

If followers bought revenue, this cloud would slope up from corner to corner. Instead it fills the whole square — the rank correlation is 0.17.

n = 541 startups with both a follower count and non-zero revenue · bubble size = paying subscribers · 307 zero-follower and 216 zero-revenue startups fall off a log scale and are excluded

Bottom right is the graveyard. 21 startups here have 10,000+ followers and under \$1,000 a month.

Top left is where the money is. Stack Influence earns \$868,000 a month with 900 followers.

Search authority moves revenue 6,000×

Swap the follower count for the two things that do predict revenue, and the picture stops being noise.

Spearman rank correlation with 30-day revenue (top) · median 30-day revenue by domain-rating band (bottom) · n = 1,000, 714 with a domain rating

A domain rating of 60+ earns 6,419× a rating of zero — \$42,813 a month against \$7. Nothing else in this file separates outcomes that hard.

Followers are a founder asset; authority is a business asset. One of them transfers to the company. The other leaves when the founder does.

Volume of builders is not volume of buyers

Shade is revenue per startup, not startup count. The map that matters is where the paying customers are.

23 countries with at least 5 startups · grey = fewer than 5 in this dataset · 241 of the 1,000 rows list no country at all

HIGHEST REVENUE DENSITY

1	UAE	\$3.6k	n=8
2	Singapore	\$1.9k	n=9
3	Estonia	\$1.8k	n=9
4	United States	\$1.4k	n=258
5	Canada	\$1.2k	n=29
6	Netherlands	\$870	n=13

Two shapes of winner, and nothing in between

Stan sells a small ticket to 101,590 people. Stack Influence sells an enormous one to 55. Both work. The muddle in the middle does not.

STARTUP	CATEGORY	SELLS TO	30-DAY REVENUE	FOLLOWERS	PAYING SUBS
Stan	Unlisted	hidden	\$2.8M	16k	102k
Brand On Demand, Inc.	E-comm	B2B	\$985k	2k	4k
Stack Influence	Marketing	B2B	\$868k	900	55

Comp AI	AI	B2B	\$575k	10k	50
1Lookup	SaaS	B2B	\$391k	4k	655
GojiberryAI	AI	B2B	\$386k	18k	5k
Stealth Company	Unlisted	hidden	\$365k	0	2k

top 8 of 1,000 by 30-day revenue · "hidden" = anonymised listing

9 of the top 10 are American and six of them are labelled B2B. Not one is a consumer productivity app.

Median followers in this group: 2,348. Seven of the ten have fewer than five thousand.

129 rows are anonymised. They earn a median of \$8,362 a month against \$255 for named startups — the most successful founders here tell you the least.

The most crowded problem is the worst paid

Box size is how many founders chose that problem. Shade is how much revenue each of them earns. Big and pale is where you do not want to be.

THE TRADE

Making content is the default idea, and being the default is exactly the problem. Selling the one thing every founder is short of turns out to be the reliable trade.

n = 682 startups with a stated problem, grouped by keyword on the founder's own description · shade = revenue share ÷ startup share

Same number of customers. Five times the price.

B2C does not fail on getting customers here. It fails on what it is allowed to charge them.

n = 712 startups with a stated audience · revenue per customer computed on the 609 with at least one paying subscriber

42% of B2B startups reach \$2,000 MRR against 27% of B2C ones.

"Both" is not the safe middle. The 56 startups selling to everyone earn a \$472 median and only 25% reach \$2k — the worst of the three.

If a consumer idea and a business version of it interest you equally, the data says build the business one.

Where the money already is

Median revenue, not average — so one \$2.8M outlier cannot carry a whole category.

n = 726 startups with a primary category · categories with at least 12 startups

Education, Marketing and Sales lead — every one of them sells to somebody whose own revenue depends on the tool working.

Productivity is the most crowded category in the file at 275 tagged startups, and it sits last at \$80 a month with 8% past \$2k.

Small businesses sell dear. Big ones sell cheap.

The multiple a seller asks moves in the opposite direction to the revenue they earn — $\rho = -0.30$.

n = 262 priced listings · multiple = asking price ÷ (30-day revenue × 12), the definition 97% of listings with non-zero revenue reconcile to

BY SIZE OF BUSINESS

\$0	0.0x	n=37
\$1–500	3.9x	n=80
\$500–2k	2.3x	n=40
\$2k–10k	2.3x	n=40
\$10k+	2.6x	n=65

Why it inverts. A \$300/month side project asking 3.9x wants about \$14,000 — a number a hobbyist pays on a feeling. A \$200k/month business asking 2.1x is negotiating with someone who will read the churn report first.

\$35,000 is the median price of a business that already works

262 of these 1,000 are for sale. A sixth of them earned nothing last month — but the ones that did are priced on cash, and cheaply.

ASKING PRICES, 262 LISTED STARTUPS

median ask \$35,000 · 96 of 262 list at \$10,000 or less

FASTEST PAYBACK AT \$2,000+ MRR

STARTUP	CATEGORY	MRR	ASK	PAYBACK
PolyPick	Fintech	\$21k	\$23k	1.1 mo
Notionlytics	Analytics	\$36k	\$48k	1.3 mo
DropPop	SaaS	\$28k	\$55k	2.0 mo
divinetalk	Social Media	\$2.1k	\$14k	6.8 mo
Leadbomb	SaaS	\$3.6k	\$25k	6.9 mo
Speel.co	SaaS	\$66k	\$500k	7.6 mo
PROSP	AI	\$128k	\$1.0M	7.8 mo
Stealth Company	No-Code	\$19k	\$160k	8.3 mo

payback = asking price ÷ current MRR, assuming revenue holds — it will not hold on its own

Sellers are stronger than the field. Median MRR of a listed startup is \$1,055 against \$187 for everyone else — founders list when there is something to sell.

Check the arithmetic before the story. Several listings quote an MRR that does not reconcile with their own 12-month revenue. Ask for 12 months of provider exports.

\$25-50k buys a business already earning \$2-4k a month. That is the same money as a year of runway with nothing at the end of it.

What could you realistically earn in month one?

Set the three controls below. The boxes recalculate against where these 1,000 startups actually landed — including the ones that landed on nothing.

WHAT ARE YOU BUILDING?

SaaS

DAYS OF REAL WORK BEFORE LAUNCH

90 days

WHO BUYS IT?

Businesses (B2B)

ROUGH MONTH

\$531

bottom of this band

MOST LIKELY

\$2.5k

the median outcome at this level of effort

IT WORKS

\$8.5k

top of this band

At \$2.5k a month you would sit above 55% of the 437 SaaS startups in this dataset. That clears the \$2,000/month line only 33% of this entire dataset reaches. 13.5% of SaaS startups here earned nothing at all last month.

How effort is modelled. Days-to-build is not a field in this data, so it is not treated as one. Effort maps through domain rating — the one variable that both takes months to accumulate and predicts revenue hard — to a percentile, read off your category's own revenue distribution. A year of work tops out at domain rating 31–60; the 60+ tier is real but takes years, so the model will not sell it to you.

It is a benchmark, not a forecast. It answers "what do startups in this position actually earn", not "what will you earn". 22% of this dataset earns nothing at all, and the model shows you that floor instead of hiding it.

The controls are live PDF form fields. They calculate in Adobe Acrobat Reader. If your viewer does not run PDF scripts, the boxes hold a worked example — open [TrustMRR-Revenue-Simulator.html](https://www.trustmrr.com/revenue-simulator.html), kept beside this file, for the full version with a distribution chart.

Build in the top-left corner

Every space in this dataset can be placed on two axes: how many people are already there, and what each of them earns. Three sit clearly in the good corner.

19 market tags with at least 25 startups · bubble size = number of startups · dashed lines are the medians across the 19

Customer Support

\$1.9k **45%** **43%** **4.2%**
median/mo past \$2k MRR growing of the field

Only 42 startups against 275 in Productivity, yet 45% clear \$2k MRR and the tag carries the richest exit multiples. Unglamorous, contractually sticky, already a budget line.

Sales

\$3.1k **52%** **57%** **4.2%**
median/mo past \$2k MRR growing of the field

Highest median revenue of any tag, highest share past \$2k, and the fastest growth — 57% grew last month against 34% of the field.

Analytics

\$886 **43%** **47%** **13.1%**
median/mo past \$2k MRR growing of the field

More contested at 131 startups, but a \$886 median and 47% growing. It is the wedge: how you earn the right to sell the other two later.

Avoid the bottom right — Productivity, Mobile Apps, Design Tools. **Caveat:** the top two tags have 42 startups each; the confidence comes from four metrics agreeing, not sample size.
