

”The average indie founder makes  
\$14,700/mo. Someone’s lying to you about  
what survival looks like.”

Welcome to the solopreneur illusion. Let's look at the actual numbers behind 1,000  
bootstrapped startups.

# The Math is **Haunting**

**\$13,472**

**The Average MRR**

Skewed heavily by a tiny handful of massive outlier monsters.

**\$282**

**The Median MRR**

Half of all real founders make less than this. Every single month.

# Myth-Busting: Followers $\neq$ Revenue

We ran the correlation between X (Twitter) followers and monthly revenue across the dataset.

## 0.02 Correlation

Virtually zero relationship. Having 300,000 followers doesn't guarantee your bank account notices.

## The Reality Check

- **The Noise:** Several accounts with 350k+ followers report **\$0 MRR**.
- **The Signal:** Multiple builders with near-zero followers quietly pull in **\$100k+ MRR** solving boring problems.

# The Silent Stagnation

Pre-Revenue (\$0 MRR)

19.7%

Stagnant Growth (0%  
MoM)

42.7%

Over **60%** of founders are either making zero dollars or completely flatlining. Current tooling builds for the 1% outlier, ignoring the median builder.

# Building for the Median

## What We're Building

A data-backed intelligence layer for the median builder: real-time benchmarking, pricing guidance, and survival metrics that replace vanity tweets with tactical reality.

## The Seed Ask

Raising capital to launch the first benchmarking and pricing platform designed specifically to lift the median solopreneur out of the valley of \$282/mo.
