

INVESTMENT COMMITTEE MEMORANDUM

TrustMRR

A payment verified view of the micro SaaS long tail, and the case for backing the marketplace that owns it

1,000

startups

\$133.8M

verified TTM revenue

\$161.7M

annualised MRR

262

live acquisition listings

Invest, but underwrite the marketplace rather than the directory: 212 companies carry 95% of the revenue and a quarter of the 262 live listings are mispriced by more than a factor of two

1 The asset is real

1,000 startups report \$133.8M of trailing revenue and \$161.7M of annualised MRR, all sourced through payment provider API keys rather than self reported forms. Stripe alone underwrites 636 records and \$119.9M.

2 The value is narrow

The top 10 companies hold 50.6% of trailing revenue and 212 companies hold 94.7% of MRR. The bottom 500 contribute 0.21%. Any monetisation model priced per listing will fail.

3 The marketplace is mispriced

262 listings carry \$86.8M of asking value. Stated multiples are anchored on ARR, yet only 51% reconcile within 25% and 22.6% are wrong by more than a factor of two.

4 The edge is verification

38 listings with ARR above \$60k are asking 3.0x ARR or less against a median of 3.18x, a \$17.5M ask on \$11.7M of verified ARR. Underwriting that spread is the business.

TrustMRR owns the only payment verified inventory of sub \$1M software businesses, in a market where buyers currently have no way to price anything

Proprietary and hard to copy

Revenue arrives through Stripe, RevenueCat, Paddle and six other provider API keys. A competitor cannot scrape this. 636 Stripe connections represent 90% of trailing revenue on the platform.

A real transaction pool

262 of 1,000 companies are already listed, a 26.2% supply rate. Combined asking value is \$86.8M with a median ask of \$35,000, so the pool spans both hobby exits and institutional size assets.

A market without a price standard

Stated multiples rank correlate 0.63 with price divided by ARR but only 0.33 with price divided by trailing revenue, the basis most acquirers use. 47 listings display 0.0x. Whoever supplies the standard captures the take rate.

Ready made buy side demand

The 212 companies above \$10k MRR are exactly the acquisition target profile for search funds, holdcos and PE rollups now active in the sub \$5M software segment.

TrustMRR converts a payment API connection into two products: a public revenue credential and a liquidity venue for the resulting listings

Where the money can come from

Success fee on transacted listings is the only revenue line the data supports at scale. A per listing subscription would monetise 1,000 accounts of which 391 report under \$100 of monthly revenue, while a 5% fee on the \$86.8M live pool is worth \$4.3M gross at full clearance and roughly \$650k at a 15% clear rate.

The revenue spine is complete and clean; everything used to segment, price or market the inventory is not

Field completeness gaps (% of 1,000 records missing)

PASS

Zero missing on the revenue spine

record_id, MRR, and all four revenue windows are 100% populated with no duplicate record ids.

WATCH

129 anonymous records hold \$28.6M

Stealth Company rows carry 21% of trailing revenue with no category, audience or country attached.

FAIL

128 records fail an internal consistency test

MRR multiplied by six exceeds trailing twelve month revenue, and 32 records show 3 month revenue below 30 day revenue.

FAIL

Traffic data is effectively absent

Only 178 records carry visitor counts, so unit economics cannot be built from acquisition cost.

KEY PERFORMANCE INDICATORS

Nine metrics frame the asset: large aggregate revenue, tiny median company, and a supply side already flagged for sale

\$133.8M

Trailing 12 month revenue

\$161.7M

Annualised MRR

\$3,069

Median company TTM revenue

\$282

Median company MRR

212

Companies above \$10k MRR

16

Median active subscriptions

26.2%

Of companies listed for sale

\$86.8M

Total asking value

21.6%

Report zero 30 day revenue

The gap between the \$133.8M aggregate and the \$3,069 median is the whole story: this is not a market of a thousand businesses, it is a market of roughly two hundred businesses plus eight hundred profiles.

Source: TrustMRR frozen extract, 30 July 2026, n = 1,000.

REVENUE CONCENTRATION

Ten companies produce half of all revenue on the platform and the bottom 500 produce 0.21%, so platform economics must be built around the head

Cumulative share of \$133.8M trailing revenue

Stan alone is 18.7% of the platform

One company, \$25.0M of trailing revenue and \$3.57M of MRR across 101,590 subscriptions. Losing it would remove almost a fifth of the platform's headline number.

The long tail is a marketing asset, not a revenue asset

500 companies together contribute \$281k of trailing revenue. They matter for search volume and network effect, and should cost close to nothing to serve.

Implication for pricing

Charge the head for liquidity and distribution; keep the tail free and automated. A flat fee across 1,000 accounts destroys value at both ends.

Source: revenue_12m_usd ranked descending across 1,000 records.

212 companies above \$10k MRR hold 94.7% of platform MRR; the 391 accounts below \$100 are a cost line, not a customer segment

Companies by MRR tier

Share of \$13.5M monthly recurring revenue

Company count is almost perfectly uniform across the five tiers, roughly 197 each, while MRR is not. Equal supply, radically unequal value: the platform's segmentation must be built on revenue tier, not on category or geography.

Source: mrr_usd across 1,000 records. Tier counts: 197 / 194 / 197 / 197 / 212.

B2B is 36% of profiled companies but 70% of profiled revenue, and earns five times the revenue per subscriber

What happened

401 B2C companies generate \$20.9M while 255 B2B companies generate \$53.3M. Median B2B company revenue is \$8,362 against \$2,213 for B2C.

What it means for the platform

Buyer demand concentrates where cash flow is durable. Prioritising B2B supply raises average deal size and take rate without adding listings.

Base: 712 records with audience type populated; 288 records are blank and excluded from these three charts.

AI supplies one in five listings but Marketing, Education and Content Creation produce two to three times the median revenue per company

Median trailing revenue per company, top 10 categories by total revenue

Category	n	Total	Median	Listed
AI	197	\$18.43M	\$4,301	27.4%
Marketing	42	\$14.64M	\$10,028	21.4%
Ecommerce	19	\$12.02M	\$4,310	31.6%
SaaS	66	\$6.56M	\$2,281	33.3%
Education	30	\$5.52M	\$14,309	33.3%
Analytics	19	\$3.75M	\$3,876	36.8%
Content Creation	36	\$1.85M	\$13,732	30.6%
Mobile Apps	52	\$1.65M	\$1,745	55.8%

Where to hunt

Mobile Apps has the highest listing rate at 55.8% and the second lowest median revenue at \$1,745. Supply is abundant and cheap there. Education carries the highest median at \$14,309 across only 30 companies, so demand generation should target that category specifically.

Base: 726 records with a category label. Categories with fewer than 15 companies are excluded.

Only 274 of 893 companies with reported growth are actually growing, and 381 report exactly zero, which is a measurement failure as much as a business one

Companies by 30 day MRR growth band

238 companies are shrinking

62 lost more than a fifth of MRR in thirty days. Their combined MRR is \$3.5M, so decay is not confined to dormant accounts.

381 exact zeros are suspicious

A precise 0.0% reading across 43% of records points to stale snapshots or accounts with no billing event in the window, not to genuinely flat businesses.

Growth sits in the middle band

The 142 companies growing 0% to 20% hold \$6.2M of MRR, 46% of the platform total. Steady compounders, not hypergrowth, are the asset class here.

Base: 893 records with mrr_growth_30d_pct populated. 107 records are blank.

One integration, Stripe, carries 90% of verified revenue on the platform; the newer providers deliver volume with almost no revenue behind it

Trailing revenue by payment provider

Single point of failure

636 of 1,000 connections run through Stripe. An API policy change, a rate limit or a competing Stripe owned directory would compromise the core product.

Superwall punches far above its count

17 companies, a \$22,077 median trailing revenue and 729 median subscriptions, the strongest cohort on the platform. Deepening that integration is cheap leverage.

Polar and Dodo add noise

86 companies between them contribute \$0.36M. 41.7% of Polar records report zero trailing revenue, which drags median quality and buyer trust.

Base: providers with at least 15 connected companies. 13 companies connect two providers.

MARKET COVERAGE

The United States is 34% of profiled companies and 64% of all revenue; India contributes 59 companies at a \$97 median, so coverage does not equal value

Trailing revenue by country, markets with 15 or more companies

Market	Companies	Total revenue	Median revenue
US	258	\$85.03M	\$12,292
FR	79	\$6.09M	\$4,787
GB	50	\$4.79M	\$1,124
CA	29	\$3.08M	\$8,165
IN	59	\$1.17M	\$97
HK	19	\$1.15M	\$773
AU	17	\$1.01M	\$2,576
PL	15	\$0.99M	\$3,097

France is the surprise: 79 companies and a \$4,787 median, second only to the United States on count. Any expansion budget should follow that signal rather than raw population.

Base: 759 records with a country. 241 records have no country attached, including several of the largest by revenue.

The \$86.8M of live supply is barbelled: 96 listings under \$10,000 contribute 0.5% of value while 21 listings above \$1M contribute 60%

Total asking value by price band, \$M

262

listings live

\$86.8M

combined ask

\$35,000

median ask

42.3%

value in top 10 listings

Two marketplaces in one

The 96 listings below \$10,000 need a self serve, zero touch flow; the economics do not support a human in the loop. The 63 listings above \$250,000 carry \$78.4M of value, 90% of the pool, and justify a brokered process with diligence, escrow and a negotiated fee. Running one process for both is the fastest way to lose the high value sellers.

Base: 261 listings with an asking price. One flagged listing has no price attached.

THE CENTRAL PROBLEM

Listing multiples are anchored on ARR rather than trailing revenue, and one listing in four is wrong by more than a factor of two

Stated multiple against price divided by ARR, 187 listings shown (both values 15x or below)

The base is ARR, not revenue

Rank correlation with price divided by ARR is 0.63 and the median ratio between the two is 1.00. Against trailing revenue it falls to 0.33, so the headline multiple answers a question few acquirers ask.

Dispersion is the real defect

Only 51% of listings reconcile within 25% and 22.6% are off by more than a factor of two. 47 listings display an impossible 0.0x and 36 priced listings carry no MRR at all.

The consequence

A buyer must rebuild every calculation before comparing two listings. That friction is why \$86.8M of supply sits unsold, and fixing it is a product change rather than a capital requirement.

Thirty eight listings with more than \$60k of ARR are asking 3.0x or less, a \$17.5M ask against \$11.7M of verified annual revenue

Company	Category	Verified ARR	Asking price	Implied multiple
PROSP	AI	\$1,536,060	\$1,000,000	0.65x
Stealth Company	Undisclosed	\$1,000,056	\$3,000,000	3.00x
Speel.co	SaaS	\$790,116	\$500,000	0.63x
GoTall	Health & Fitness	\$702,120	\$1,000,000	1.42x
Taller	Health & Fitness	\$530,508	\$750,000	1.41x
Stealth Company	Undisclosed	\$439,524	\$1,000,000	2.28x
Notionlytics	Analytics	\$437,484	\$48,000	0.11x
Conductor	Dev Tools	\$424,692	\$1,250,000	2.94x

Read the screen carefully

Notionlytics at 0.11x and DropPop at 0.16x are either genuine mispricings or data errors. Both are testable in an afternoon with a provider level revenue pull.

The other side of the book

29 listings are asking 10x ARR or more, \$8.9M of ask that will not clear. Median across the pool is 3.18x, which is the anchor a pricing engine should publish.

Four risks are material; two of them, key company concentration and provider dependence, are structural and cannot be fixed by execution alone

RISK	EVIDENCE	MITIGATION
HIGH Key company concentration	Ten companies are 50.6% of platform revenue and Stan alone is 18.7%. Departure of the head materially resets every headline metric.	Diversify the head by recruiting 50 companies above \$100k ARR. Report metrics excluding the top 10 in every board pack.
HIGH Payment provider dependence	Stripe carries 636 connections and 90% of revenue. A terms change or a first party competing product removes the moat.	Reach 25% of revenue on non Stripe rails within 12 months. Superwall and Paddle cohorts are the highest quality starting point.
MEDIUM Data integrity and trust	128 records fail an internal consistency test, 47 listings show a 0.0x multiple and 381 report exactly zero growth.	Publish a verification standard with a visible timestamp. Suppress any listing that fails reconciliation rather than displaying it.
MEDIUM Unproven clearance	The dataset contains no completed transactions, so the take rate that underwrites the whole model is untested against real closings.	Make the investment tranchied. Release the second tranche on a demonstrated closed deal count over two consecutive quarters.

Four moves, ranked by value released per unit of effort: fix pricing first, because every other lever depends on listings a buyer can trust

- | | | | |
|----|--|---|---|
| 01 | Publish a verified pricing standard | Replace the seller entered multiple with two computed figures, asking price over ARR and over trailing twelve month revenue, recalculated on every data refresh and shown against the 3.18x pool median. Suppress the 47 listings displaying 0.0x until they reconcile. | Unlocks \$86.8M of supply currently unscreenable |
| 02 | Split the funnel at \$250,000 | Self serve, zero touch flow for the 199 listings below the line; brokered process with diligence and escrow for the 63 above it, which hold \$78.4M of the value. | Concentrates human cost on 90% of the pool value |
| 03 | Recruit against the B2B gap | Target Marketing, Education and Analytics founders above \$10k MRR. Those categories carry medians two to four times the platform average and the 212 company core is where buyer demand already sits. | Raises average deal size without adding volume |
| 04 | Reduce Stripe dependence | Deepen Superwall and Paddle integrations, whose cohorts show the strongest median revenue on the platform, and set a 25% non Stripe revenue target for the next twelve months. | Removes the single largest structural risk |

Twelve months to a credible marketplace: prove clearance by quarter two, then scale supply against demonstrated demand rather than ahead of it

Quarter 1	Trust	Quarter 2	Liquidity	Quarters 3 to 4	Scale
Fix the record • Computed multiples replace stated ones on all 262 listings • Reconciliation test suppresses the 128 inconsistent records • Verification timestamp shown on every profile		Prove clearance • Brokered pilot on the 63 listings above \$250k • Target 8 closed transactions and a published take rate • Test the 38 listing arbitrage screen against real bids		Scale the head • Recruit 50 companies above \$100k ARR in B2B categories • Push non Stripe revenue share to 25% • Open a buyer side subscription for screened deal flow	

Gate the second capital tranche on quarter two: eight closed transactions and a published take rate, or the model is unproven and the investment should not scale.

INVESTMENT CONCLUSION

Proceed, with a tranching structure gated on transaction clearance

What we are buying

A verified revenue dataset covering \$161.7M of annualised MRR that no competitor can scrape, attached to \$86.8M of live acquisition supply.

What we are fixing

A pricing display that half of buyers cannot use. 22.6% of listings are off by more than a factor of two, 47 show an impossible 0.0x, and the multiple is anchored on ARR rather than trailing revenue.

What we are betting on

That verified pricing converts idle supply into closed transactions. 38 listings already sit at or below 3.0x ARR against a 3.18x median, so the spread exists.

What would change our mind

A quarter two pilot that closes fewer than eight of the 63 premium listings, or evidence that the 381 exact zero growth readings reflect a broken data pipeline.

Detailed exploratory data analysis: method, tests run and the findings that did not make the main narrative

Method

1,000 records, 29 fields. Distribution analysis on 12 numeric fields, log transformed correlation matrix on revenue drivers, segmentation across category, audience, provider and country, and a consistency test suite across the four revenue windows.

Distribution

Every revenue field is severely right skewed. Trailing revenue: median \$3,069, mean \$133,750, maximum \$25.0M. The mean exceeds the 90th percentile, so mean based reasoning is unusable throughout.

Correlation

Against log trailing revenue: MRR 0.86, active subscriptions 0.77, domain rating 0.29, X followers 0.21, visitors 0.11. Audience size and SEO authority are weak revenue proxies; subscription count is a strong one.

Momentum

Annualising 30 day revenue against the trailing figure gives a median ratio of 1.37, so the typical company is accelerating. 11% of the 605 testable companies sit below 0.5, indicating material decay.

Market breadth

Companies tagged into five or more markets show a \$6,310 median trailing revenue against \$1,316 for single market companies. Breadth correlates with revenue, though direction of causation is untested.

Outliers retained

Six companies report MRR growth above 1,000%, peaking at 12,983%. These were retained in counts but excluded from medians. 32 records show 3 month revenue below 30 day revenue, which is arithmetically impossible.
