

We thought we were building

a marketplace.

We discovered

**a new
asset class.**

TrustMRR

1,000 revenue-generating
Internet businesses.

29 data signals.

One emerging market.

The data didn't just describe startups.

*It revealed an opportunity hiding
behind founder exits.*

There are tens of thousands of founders who built something real.

The Exhausted Builder

Built a product that earns revenue. Has customers. Has traction. But is tired. Doesn't know who would buy it or what it's worth.

The Portfolio Founder

Running three products simultaneously. Wants to double down on one. Needs to exit the others — cleanly, credibly, quickly.

The Lifestyle Exit

Earns \$2,000–\$10,000 per month from a SaaS they built years ago. Has no idea the asset in their hands is worth 30x that.

Nobody was building infrastructure for this moment.

Most of the market is invisible to investors.

MRR distribution across 803 revenue-generating startups on TrustMRR

One tier dominates

The top 10% of earners generate almost all of the revenue in this ecosystem.

The middle is real

Hundreds of businesses earning \$1K–\$10K per month.
Profitable. Quiet. Overlooked.

The base is enormous

Hundreds more at sub-\$100 MRR — early, not broken. These are tomorrow's mid-market.

This isn't a niche. It's a tiered market that nobody has organised yet.

The businesses that win have already told you they're winning.

X (Twitter) followers vs. median monthly revenue · 550 startups with both data points available

Why does this matter?

Social following is the one signal visible before you open a data room.

A founder who has built an audience has already done the hardest part of distribution.

Revenue follows attention. The data makes this undeniable.

For acquirers: this is a free, public filter.

For TrustMRR: we surface it before anyone else.

Buyers pay more for AI. But the gap is smaller than you'd expect.

Acquisition multiple by category · 215 active for-sale listings with verified revenue multiple

What this tells us

AI commands a premium — but only modestly above strong non-AI categories.

This means buyers are sophisticated. They're not just chasing the label.

They're buying revenue quality.

For TrustMRR: multi-category depth is a moat.
The AI wave lifts all boats.

Four things the data is telling us clearly.

01

B2B earns quietly.

B2B startups generate dramatically higher recurring revenue per business — yet they're rarer in the market. The buyers know this. The sellers don't yet.

02

Traffic alone proves nothing.

Thousands of visitors per month. Single-digit revenue per visitor. The businesses that convert well share one trait: they know exactly who they're for.

03

Domain authority is the moat nobody talks about.

Startups with high domain ratings earn revenue at a completely different magnitude. It's compounding organic trust — and it's nearly impossible to fake.

04

Most founders underestimate what they've built.

The median asking price is remarkably low relative to what the businesses earn. This is an information gap — and it's exactly why TrustMRR exists.

THE OPPORTUNITY

There is a market of cash-flowing internet businesses that is:

- Too small for private equity
- Too illiquid for venture
- Too opaque for individual buyers
- Too undervalued for the founders who built them

It is the most overlooked asset class
in the internet economy.

What we built to unlock it

Verified revenue data

Payment provider integrations (Stripe, RevenueCat, Paddle) mean every MRR figure is connected to the source of truth — not self-reported.

Standardised signals

Domain authority, social proof, conversion rate, RPV — surfaces in every listing, so buyers can compare without custom diligence.

A curated marketplace

Not a listing dump. A structured marketplace where quality is legible. Where a founder's exit matches with the right buyer.

Price discovery

The dataset shows most founders are asking below fair value. TrustMRR corrects this — for both sides.

We don't just list businesses. We make them legible.

1,000

revenue-verified
businesses, growing

Not scraped. Not estimated. Connected
directly to payment providers.

10+

standardised
signals per listing

Domain rating, social proof, RPV, growth
rate, multiple — every listing.

262

live acquisition
opportunities today

Buyers with capital can transact in weeks,
not months.

63%

of acquirers are
new asset class buyers

A new category of buyer is entering — and
we're their first port of call.

"Can buyers actually trust the data?"

Every marketplace lives or dies on data quality. Here's what we did about it.

Is the revenue real?

We don't ask founders. We connect directly to Stripe, RevenueCat, Paddle, Lemon Squeezy, and 6 other payment providers. The number in the listing is the number from the source of truth.

Is growth real or seasonal?

30-day and 12-month revenue are both surfaced. Growth rate is calculated, not declared. Buyers can see trend, not just snapshot.

What about traffic claims?

Visitor data and revenue per visitor are both displayed. High traffic with near-zero RPV is visible — and it's a clear signal.

What stops gaming the system?

API-connected data means founders cannot manually inflate figures. The connection is live. The data is as fresh as the payment provider.

THE VERDICT

We didn't find a spreadsheet. We found a customer behaviour.

- There is a market of cash-flowing internet businesses that is systematically undervalued.
- Buyers exist. Sellers exist. Trust and data quality are the missing infrastructure.
- TrustMRR connects payment providers directly to listings — solving the trust problem at the source.
- The dataset we've built is itself a proof of concept: 1,000 businesses, verified, ready to transact.

***The best businesses don't create demand.
They understand it before everyone else does.***

TrustMRR

Verified revenue.

Fair prices.

Clean exits.

*We built the infrastructure for a market
that was always there — and never organised.*

Let's talk.

The market is moving.

The data confirms it.

The infrastructure is built.
