

PORTFOLIO STRATEGY REVIEW

The TrustMRR Portfolio

8,782 Startups Under the Microscope

A board-level assessment of revenue quality, growth durability, concentration risk and capital-allocation opportunity across the full tracked universe.

8,782

Companies tracked

\$33.9M

30-day revenue

117

Countries

97%

Revenue in top decile

A note on scope: this is 8,782 companies, not ~1,000

The source file frozen 30 Jul 2026 is materially larger than the initial brief assumed. We analyzed the full dataset as received rather than a sample.

8,782

Companies in the frozen dataset

117

Countries represented

31

Product categories tracked

5

Data domains reconciled: identity,
revenue, MRR/usage, category, exit/
monetization

Extraction approach & confidence

- High confidence: company identity, country, X-follower counts, all four revenue windows, MRR, growth %, active subscriptions, sale status, asking price, revenue multiple — cleanly parsed and cross-validated on row counts.
- Best-effort (~71% coverage): product category, reconstructed from a nested market-tag field; remaining rows shown as "unclassified" rather than guessed.
- Not reliably recoverable: free-text pricing tiers, target-persona narrative, and problem-statement fields — the source PDF's text layer overlaps at the character level for long wrapped cells and cannot be split with confidence, so these are excluded rather than reported inaccurately.

Ten takeaways for the partner meeting

1

A revenue base, not a portfolio of equals

Top 10% of companies generate 97% of all revenue; the median company earns \$0/month. Portfolio value is a handful of positions, not a diversified base.

2

One anonymized cohort explains half the book

560 "stealth"/anonymized entries (6.4% of companies) generate 50% of total revenue — the single largest governance and diligence gap in the dataset.

3

Half the portfolio is pre-revenue or dormant

51% of tracked companies show \$0 in trailing 30-day revenue — either early-stage, abandoned, or mis-tracked.

4

Growth is bimodal, not normal

56% of companies show ~0% growth (stalled), 25% are declining, and 8% are in hypergrowth (>50%/mo) — few companies sit in a "steady compounding" middle.

5

Productivity, AI and SaaS carry the portfolio

These three categories alone contribute 53%+ of tracked revenue; AI is the largest category by company count (751) but a mid-pack performer by revenue per company.

1

Social proof does not predict revenue

Follower count correlates with revenue at $r=0.01$ — audience size is not a reliable signal of monetization in this portfolio.

2

MRR and realized revenue disagree

Stated MRR correlates with 30-day GMV at only $r=0.09$, pointing to inconsistent revenue recognition or stale MRR snapshots across the book.

3

Geography is US-anchored but not US-exclusive

The US contributes 21% of revenue from 18% of companies; Hong Kong is a disproportionate #2 by revenue concentration.

4

A fifth of the book is already for sale

22% of companies (1,952) are actively listed, at a median asking multiple of ~1.0x trailing revenue — a signal of founder fatigue at the long tail.

5

The opportunity is triage, not blanket investment

With revenue this concentrated, the highest-leverage moves are: double down on proven categories, professionalize the stealth cohort, and deprioritize the ~4,500 companies with no monetization signal.

A large, long-tailed portfolio with a thin core of real businesses

Reading the base rate

- Median 30-day revenue is \$0; mean revenue is \$3,865 — the gap between median and mean is itself the headline: a small number of large earners pull the average far above the typical company's experience.
- 117 countries and 31 categories are represented, but participation is shallow in most — the portfolio is wide, not deep, across most geographies and verticals.
- Business maturity is polarized: a maturity core of Stripe-integrated, subscription-billed companies coexists with a much larger cohort of pre-revenue or hobby-stage listings on lighter-weight billing rails (see Section 12).

KEY TAKEAWAY

This is a power-law portfolio. Treat the top decile as the business; treat the rest as an option book.

RECOMMENDED ACTION

Segment reporting and resource allocation by revenue tier, not by category or geography alone.

Revenue tiers: the portfolio's center of gravity is \$0–\$1K/month

Fact vs. interpretation

FACT: 3,111 companies sit in the \$1–\$1K band; only 9 companies exceed \$500K/month.

FACT: The \$10K+ tiers (298 companies, 3.4% of the portfolio) already represent durable, fundable businesses.

INTERPRETATION: The \$0 and sub-\$1K tiers are not one population — they blend true pre-launch companies with abandoned or mis-integrated ones. Billing-provider connection status is a useful cheap filter to separate the two before deeper diligence.

Concentration risk: 10% of companies carry 97% of revenue

21%

of ALL revenue from one company

76%

of revenue from top 1% (88 cos.)

97%

of revenue from top 10% (878 cos.)

Concentration this extreme means portfolio-level KPIs (mean revenue, mean growth) are driven almost entirely by single-digit numbers of companies — they should never be reported without the median alongside.

The single biggest blind spot: anonymized companies

Companies tagged "Stealth Company," "Anonymous Startup," "Hidden Business/Venture," or "Private Enterprise" in the source data

560

Anonymized companies (6.4% of portfolio)

50%

Share of total portfolio revenue

14.7x

Average revenue vs. disclosed companies

Why this matters

The single largest revenue line in the entire dataset — \$7.14M/month — belongs to an unidentified "Anonymous Startup." Four of the ten largest revenue generators in the portfolio carry no disclosed name, country, or category.

This is not necessarily a red flag on the underlying businesses — but it is a red flag on portfolio governance. Half the book's economics are currently un-auditable at the standard diligence fields (geography, category, identity).

KEY TAKEAWAY: *Treat the anonymized cohort as its own risk class, not as noise to exclude from analysis.*

Growth is bimodal: most companies are either stalled or sprinting

56%

Flat / no growth signal (~0%)

25%

Declining month-over-month

8%

Hypergrowth (>50%/month)

Sustainable growth reads as steady 5–20%/month, not the extreme tails — hypergrowth outliers often reflect a low base or a one-time spike, not compounding demand.

03 • GROWTH ANALYSIS

Fintech and Analytics grow fastest; Games and Design Tools are shrinking

Reading the matrix

FASTEST-GROWING: Analytics (+42% median), Fintech (+34%), Content Creation (+16%) — all still small in absolute revenue.

SLOWEST / DECLINING: Design Tools (–6%), Games (–6%), Travel (–1%) — small categories with negative median momentum.

SCALE LEADERS: Productivity and AI carry the most revenue but near-flat median growth — mature, defensible, but not compounding fast.

03 • GROWTH ANALYSIS

Movers: who's compounding and who's cratering (min. \$5K/mo revenue)

Fastest growers

Company	Geo	Category	Rev (30d)	Growth
Stealth Company (redacted)	—	—	\$12,310	+1230899%
Stealth Company (redacted)	—	Marketing	\$15,654	+8096%
Sermon Scribe	—	Travel	\$11,699	+5076%
Mentionable 1	FR	—	\$7,493	+3094%
Nocapmocap	US	Mobile Apps	\$11,786	+1810%
Hidden Venture 12345	—	Marketing	\$87,529	+1530%

Steepest declines

Company	Geo	Category	Rev (30d)	Growth
Juiced Leads Llc	US	—	\$5,799	-76%
Coralflavor	US	—	\$5,149	-65%
Pdb Online Diensten	NL	—	\$24,463	-65%
Paccofly	IT	AI	\$6,744	-63%
Friendfilter Groupfilter	US	AI	\$68,817	-62%
Overrank Seo	US	—	\$16,833	-58%

KEY TAKEAWAY: Extreme growth rates at this revenue scale (\$5–90K/mo) are usually base-effect artifacts (a new payment integration, a viral spike) rather than durable trend — verify with 3-month and 12-month windows before acting. Declines above 50%/mo at meaningful revenue warrant an immediate call to the founder.

Revenue spread by category: wide dispersion even among leaders

Median vs. mean, by the numbers

Segment	Median	Mean
Portfolio-wide	\$0	\$3,865
Revenue-generating only	\$580	\$7,884

Even within revenue-generating companies only, the mean (\$7,884) is 13.6x the median (\$580) — the box plot confirms this isn't a data artifact: every top category shows multi-order-of-magnitude spread between its smallest and largest earners.

Long-tail dynamic: the bottom half of revenue-generating companies in every category earns under ~\$500/month — consistent with a portfolio of side-projects and early-stage tools rather than funded operating companies.

The revenue leaderboard: eight companies, one governance question

Company	Geo	Category	Revenue (30d)	Growth	% of Portfolio
Stealth Company (redacted)	—	—	\$7,143,938	n/a	21.0%
Postiz	HK	Productivity	\$2,844,652	-8%	8.4%
Stealth Company (redacted)	—	—	\$2,703,570	n/a	8.0%
Llm Gateway	US	—	\$984,522	+4%	2.9%
Stealth Company (redacted)	—	—	\$868,322	+8%	2.6%
Stealth Company (redacted)	—	—	\$857,622	+719%	2.5%
Maidsnblack	US	—	\$575,343	+4%	1.7%
Stealth Company (redacted)	—	Social Media	\$509,774	+8%	1.5%

KEY TAKEAWAY: These 8 companies alone represent ~40% of total portfolio revenue. Half of them are anonymized. Identity verification on this list should be the single highest-priority diligence action from this review.

Where the revenue actually lives: Productivity, AI, SaaS dominate

Category Revenue Map — Top 14 Categories by 30-Day Revenue

Category scorecard: revenue, count, and monetization rate

Category	Companies	Total Rev (30d)	Avg Rev/Co.	% Monetizing
Productivity	237	\$3,054,690	\$12,889	55%
AI	751	\$1,521,543	\$2,026	59%
SaaS	295	\$786,223	\$2,665	59%
Social Media	54	\$526,300	\$9,746	56%
Marketing	168	\$333,099	\$1,983	61%
Health & Fitness	140	\$282,138	\$2,015	65%
Mobile Apps	108	\$281,884	\$2,610	69%
Education	141	\$249,299	\$1,768	58%
E-comm	49	\$238,635	\$4,870	61%
Content Creation	131	\$208,877	\$1,594	55%
Security	18	\$173,528	\$9,640	44%
Entertainment	39	\$152,296	\$3,905	56%
Dev Tools	208	\$151,547	\$729	55%
Sales	29	\$141,274	\$4,872	72%

Winners & underperformers

WINNERS

Productivity (\$3.05M, 38% of tracked revenue from just 237 companies — the highest revenue-per-company base) and Social Media (small n, \$9,746 avg revenue — a monetization-efficient niche).

UNDERPERFORMERS

Dev Tools (208 companies, only \$729 avg revenue — high builder interest, weak monetization) and Fintech (100 companies, \$551 avg — likely blocked on compliance/trust rather than demand).

WATCH

AI has the most companies (751) but only mid-pack revenue per company — a crowded category where differentiation, not category selection, will decide winners.

US-anchored, but Hong Kong punches far above its company count

Top 15 Countries by Portfolio Revenue (min. 15 companies)

Geographic concentration

US: 18% of companies (1,577), 21% of revenue — the anchor market by both measures.

Hong Kong: just 104 companies but \$2.93M in revenue (\$28,195 avg/company — 6x the US average) — a small, unusually monetized cluster worth a dedicated look.

India: largest company count outside the US (769) but lowest monetization rate among major markets (37% generating any revenue, \$416 average) — a volume-not-value market today.

Top 3 countries: concentrate ~48% of total revenue — real, but materially less extreme than the company-level concentration seen in Section 2.

Emerging ecosystems: smaller markets with outsized revenue per company

Country	Companies	Avg Revenue / Company
Ukraine (UA)	39	\$13,097
Slovenia (SI)	14	\$8,824
Lithuania (LT)	33	\$5,703
New Zealand (NZ)	13	\$4,783
Singapore (SG)	65	\$3,963
Cyprus (CY)	11	\$2,694
Estonia (EE)	54	\$2,480
Belgium (BE)	48	\$2,176

Opportunity read

Ukraine leads emerging markets at \$13,097 average revenue per company across 39 companies — comparable engineering-heavy ecosystems (Lithuania, Estonia) show the same pattern: small counts, high monetization.

This looks like a talent-arbitrage signal: technically strong, English-fluent founder bases building for global (often US) customers while operating at local cost bases — a structurally attractive combination for follow-on capital.

Note: Anguilla (ISO "AI") excluded from this view to avoid confusion with the AI product category.

What's working in this portfolio

1

A genuine power-law core exists

Nine companies clear \$500K/month and 298 clear \$10K/month — proof the platform can originate and surface real, fundable businesses, not just hobby projects.

2

High-growth pockets are real and diversified

708 companies (8.2%) are in hypergrowth across categories from Fintech to Content Creation — momentum is not confined to one vertical.

3

Billing infrastructure is modern and consolidated

59% of companies bill through Stripe and a small set of modern providers (RevenueCat, Polar, Lemon Squeezy) — clean, auditable revenue data versus legacy billing sprawl.

4

Geographic reach is broad without being shallow everywhere

117 countries represented, with several (Hong Kong, Ukraine, Lithuania) showing genuine monetization depth, not just headcount.

5

Category diversification limits single-vertical risk

No single category exceeds ~38% of revenue; a downturn in any one vertical would not be portfolio-threatening on its own.

What's structurally weak in this portfolio

1

Over half the portfolio has no monetization signal

51% of companies show \$0 in trailing-30-day revenue — a large share of tracked "startups" are pre-revenue, dormant, or abandoned.

2

Revenue quality is unverifiable for the biggest earners

560 anonymized companies — including the single largest revenue line in the dataset — cannot be diligenced on category, geography, or identity.

3

Growth is mostly stalled, not just slow

56% of companies with growth data show ~0% month-over-month change — the modal outcome is stagnation, not gradual growth.

4

Weak categories carry real company counts

Dev Tools (208 companies, \$729 avg revenue), Fintech (100, \$551 avg), and Design Tools (67, \$477 avg) show high founder interest but poor monetization — capital or attention may be misallocated here.

5

Revenue-recognition data is inconsistent

MRR and 30-day realized revenue correlate at only $r=0.09$ — billing data across the portfolio is not standardized enough to trust blended metrics without company-level verification.

Where the portfolio could unlock growth — ranked by expected impact

Opportunity	Rationale	Impact
Identity-verify the top 25 revenue companies	40%+ of portfolio revenue sits with 8 companies, half anonymized — closing this gap de-risks the core of the book's value.	High
Double down on Hong Kong & Ukraine-style clusters	Both show 5–6x average revenue vs. portfolio norm on modest company counts — a repeatable sourcing/monetization pattern worth studying and replicating.	High
Build a monetization playbook for Dev Tools & Fintech	300+ companies with strong founder interest but weak revenue — likely fixable with pricing, compliance, or GTM support rather than product rebuilds.	High
Cross-sell payment-rail upgrades to legacy billing cohort	Companies on lighter-weight rails (Dodo Payments: \$128 avg revenue) trail Stripe-integrated peers (\$5,743 avg) by 45x — infrastructure maturity itself may be gating growth.	Medium
Triage the \$0-revenue cohort into an activation program	4,481 companies generate no revenue — even a 5% activation rate at category-average revenue would be a meaningful uplift.	Medium
Package the 22% "on sale" cohort as a structured secondary program	1,952 companies are already listed at a median ~1.0x multiple — a curated marketplace or bulk-acquisition vehicle could unlock liquidity cheaply.	Medium
Investigate the follower/revenue disconnect as a GTM gap	36 companies have 50K+ followers but under \$1K/month revenue — an unusually clean monetization-upsell target list.	Low

Risk landscape: concentration and opacity dominate the priority zone

Portfolio Risk vs. Impact Matrix

Priority risks

1. Revenue concentration

Top 1% = 76% of revenue. A handful of company-level events (churn, fraud, mispricing) could swing headline portfolio numbers materially.

2. Stealth-cohort opacity

50% of revenue is un-auditable on standard fields. This is a diligence and reporting-integrity risk, not just a data gap.

3. Declining-company exposure

25% of companies with growth data are shrinking — left unaddressed, this erodes the base the top decile is built on.

4. Data-quality / recognition risk

Weak MRR-to-GMV correlation means blended metrics should be treated as directional, not precise, until reconciled.

Statistical outliers worth a direct look

REVENUE OUTLIER

Anonymous Startup 25

\$7.14M/month — 21% of total portfolio revenue in one unverified company. 3.6 standard deviations above the category mean.

GROWTH OUTLIER

Stealth 03

+1,230,899% in 30 days on \$12.3K revenue — a base-effect artifact (likely \$0 to \$12.3K), not organic hypergrowth.

DECLINE OUTLIER

Juiced Leads LLC

-75.7% in 30 days at \$5.8K revenue — steepest verified decline above the \$5K materiality threshold.

ENGAGEMENT OUTLIER

36 companies

50,000+ X followers but under \$1,000/month revenue — the largest audience-to-revenue mismatch cluster in the dataset.

What actually predicts revenue? Not what you'd expect

Meaningful relationships only

Asking price ↔ Revenue ($r=0.81$) & MRR ($r=0.81$)

Expected and healthy — the marketplace prices companies primarily off realized revenue, as it should.

MRR ↔ Active subscriptions ($r=0.90$)

Strong and expected — subscription count is doing what it should to explain MRR.

MRR ↔ 30-day revenue ($r=0.09$) — weak

The two revenue measures barely move together. This points to stale MRR snapshots, one-time-purchase businesses miscoded as subscription, or timing mismatches between data sources.

Followers ↔ Revenue ($r=0.01$) — negligible

Social audience size has essentially no relationship with monetization in this portfolio — a useful myth-buster for anyone using follower count as a screening proxy.

Portfolio SWOT at a glance

● STRENGTHS

- Proven power-law core (9 companies >\$500K/mo)
- Diversified hypergrowth pockets (708 companies)
- Modern, consolidated billing infrastructure
- Broad geographic reach with real depth in pockets

● WEAKNESSES

- 51% of companies at \$0 revenue
- 50% of revenue sits with unverified anonymized entities
- 56% of companies show flat/no growth
- MRR and realized revenue poorly correlated

● OPPORTUNITIES

- Identity-verify and re-underwrite top revenue cohort
- Replicate Hong Kong / Ukraine monetization pattern
- Monetization playbook for Dev Tools & Fintech
- Activation program for the dormant long tail

● THREATS

- Single-company/event risk given 21% concentration
- Governance exposure from anonymized revenue
- 25% of tracked companies actively declining
- 22% of book already listed for sale (fatigue signal)

Insights grounded in the data — part 1

OBSERVATION	EVIDENCE	BUSINESS IMPLICATION
Revenue follows an extreme power law	Top 1% of companies = 76% of revenue; top 10% = 97%.	<i>Portfolio-level KPIs must be reported with median alongside mean, or they mislead.</i>
Half the tracked base is not an operating business yet	51.0% of companies show \$0 in trailing 30-day revenue.	<i>"8,782 startups" overstates the size of the active portfolio by roughly 2x.</i>
Anonymization correlates with scale, not risk	560 anonymized companies average \$30,336/mo vs. \$2,062 for disclosed peers.	<i>Anonymity is being used by the largest, not the smallest, positions — a deliberate confidentiality choice worth understanding, not just a data gap.</i>
Growth outcomes are bimodal	56% flat, 25% declining, 8% hypergrowth — few companies in the moderate-growth middle.	<i>"Average growth rate" is a misleading single metric for this portfolio; segment by growth regime instead.</i>
Category size and category quality are different axes	AI has the most companies (751) but ranks mid-pack on revenue-per-company.	<i>Company count is a poor proxy for category attractiveness; use revenue-per-company and monetization rate instead.</i>
Billing infrastructure maturity tracks revenue maturity	Stripe-integrated companies average \$5,743/mo vs. \$128 for Dodo Payments-only companies.	<i>Payment-provider mix is a free, high-signal proxy for company stage — usable as a cheap screening filter.</i>
Social proof is not a monetization signal here	Follower count vs. revenue correlation: $r=0.01$.	<i>Any sourcing or scoring model using follower count as a quality signal should be recalibrated or dropped.</i>

Insights grounded in the data — part 2

MRR and realized revenue disagree in this dataset

MRR-to-30-day-revenue correlation: $r=0.09$.

Do not blend MRR and GMV-based revenue in a single metric without reconciliation; they answer different questions.

A fifth of the portfolio is already for sale

22.2% of companies (1,952) are listed, median revenue multiple $\sim 1.0\times$.

This is a live secondary-market signal — both a risk (founder fatigue) and an opportunity (cheap acquisition pipeline).

Geography and monetization quality diverge

India: 769 companies, 37% monetizing. Hong Kong: 104 companies, 52% monetizing at 6x average revenue.

Sourcing volume and sourcing quality require separate country-level strategies.

Small, English-fluent tech ecosystems overperform

Ukraine, Lithuania, Estonia show 3–6x average revenue vs. portfolio norm on modest counts.

A repeatable geographic pattern — worth a dedicated sourcing thesis rather than treating as noise.

Extreme growth figures are usually base-effect artifacts

Top growth outlier: +1,230,899% in 30 days on \$12.3K revenue.

Filter growth leaderboards by a revenue floor (e.g. \$5K/mo) before using them for decisions.

The audience-to-revenue gap is a targeted upsell list

36 companies have 50K+ followers but $< \$1\text{K/month}$ revenue.

A small, high-precision monetization-support outreach list — better ROI than broad-based campaigns.

Revenue multiples compress sharply outside the top categories

Median on-sale multiple is $\sim 1.0\times$; only Recruiting & HR, No-Code, and Mobile Apps clear 2.5x median.

Category should be a primary input to any acquisition or valuation model applied to this book.

Data completeness itself is a portfolio signal

29% of companies have no recoverable category tag; growth data is missing for $\sim 2\%$ of companies.

Incomplete self-reported data correlates with earlier-stage, lower-diligence companies — worth testing as a screening feature.

High-impact recommendations

Re-underwrite the anonymized top-revenue cohort

Difficulty: Medium

Horizon: 0–3 months

Priority: 1

Verify identity, geography, and category on all 560 anonymized companies, prioritizing the 8 that individually exceed \$250K/month.

Segment all reporting by revenue tier, not just category/geography

Difficulty: Low

Horizon: Immediate

Priority: 2

Replace blended portfolio averages with tier-based reporting (\$0 / \$1–10K / \$10–100K / \$100K+) across every future review.

Build and fund a monetization playbook for Dev Tools & Fintech

Difficulty: Medium

Horizon: 3–6 months

Priority: 3

300+ companies with founder engagement but weak revenue — targeted GTM/pricing/compliance support rather than fresh capital.

Medium- and low-impact recommendations

Recommendation	Impact	Difficulty	Horizon
Reconcile MRR vs. GMV reporting methodology across billing providers	Medium	Medium	3–6 mo
Launch a structured secondary/acquisition program for the on-sale cohort	Medium	Medium	3–6 mo
Study Hong Kong / Ukraine / Lithuania as a repeatable sourcing thesis	Medium	Low	3–6 mo
Design an activation nudge program for the \$0-revenue long tail	Medium	High	6–12 mo
Targeted monetization-support outreach to high-follower, low-revenue cos.	Low	Low	0–3 mo
Standardize category tagging to close the 29% unclassified gap	Low	Low	0–3 mo

If presenting to the CEO tomorrow morning

TOP 5 ACTIONS THIS WEEK

- 1 Identity-verify the 8 companies driving ~40% of portfolio revenue
- 2 Stand up tier-based (not blended) revenue and growth reporting
- 3 Reconcile MRR vs. 30-day GMV methodology with billing/data team
- 4 Pull founder calls for the 15 steepest revenue declines >\$5K/mo
- 5 Scope a monetization-support pilot for Dev Tools & Fintech cohorts

WHO NEEDS IMMEDIATE ATTENTION

Companies: Anonymous Startup 25 (\$7.14M/mo, unverified); the 8 largest anonymized earners; the 15 steepest decliners above \$5K/mo.

Categories to fund further: Productivity, SaaS, Analytics, Fintech — proven revenue quality or genuine growth momentum.

Segments to monitor, not chase: AI (crowded, mid-pack monetization), Design Tools & Games (negative median growth).

Segments to deprioritize: The ~4,500 companies at \$0 revenue, absent a low-cost activation program with a defined test-and-learn budget.

Bottom line

This is a power-law portfolio of 8,782 companies built on the economics of roughly 90.

Protect the core, verify the anonymized cohort that carries half of it, and treat the long tail as a low-cost option book rather than a reporting liability.
