

WHERE REAL REVENUE IS CONCENTRATING

A Demand-Signal Read on the Micro-SaaS Layer

803 revenue-generating startups analyzed • 197 pre-revenue listings excluded • TrustMRR marketplace data

803

companies with live MRR

\$13.5M

combined MRR analyzed

\$1,036

median MRR (skew-resistant)

57

countries represented

SCOPE CAVEAT: This is self-reported, self-selected marketplace data (many listings are for sale) — a leading indicator of bootstrapped / indie demand, not a venture-stage universe. Treat as directional, not a substitute for diligence.

Founders are piling into AI and general SaaS — volume alone is not a signal

READ

- AI (341) and SaaS (388) dominate by count — tags are multi-label, so companies stack across categories.
- High density ≠ opportunity. It signals founder conviction and rising competition in equal measure.
- Mobile Apps ranks #5 by volume (180) but, as Slide 3–4 show, is the weakest performer on revenue and momentum — a crowded, cooling category.

Six sectors hold 74% of all MRR analyzed

CAUTION Category tags are multi-label (a company can carry 2–4 tags) — these totals overlap and are not additive to a market-size figure. Read as relative concentration, not TAM.

Dev Tools and Sales-adjacent categories are growing; Mobile Apps has stalled

READ

- Metric: share of companies with positive 30-day MRR growth, base restricted to $\text{MRR} \geq \$100$ to remove tiny-base noise (going from $\$1 \rightarrow \$50 = 4,900\%$).
- 34% of all live companies report exactly 0.00% growth (likely stale updates) — medians alone understate the real split; % growing is the more robust cut.
- **Mobile Apps: only 12% growing despite 124 companies in the base — the clearest saturation signal in the dataset.**

Revenue quality vs. momentum: Analytics, Sales and SaaS clear both bars

HOW TO READ

- Bubble size = number of companies in the sector.
- Cut lines = sample median across all sectors shown (n≥15), not arbitrary.
- AI sits in Watch/Avoid despite #2 revenue rank — volume without momentum.
- Analytics and Sales clear both cuts with adequate sample size (n=93, n=35).

Lean into B2B operating tools; treat generic AI content as crowded

INVEST

- Analytics — n=93, 52% growing, \$3,633 median MRR
- Sales tooling — n=35, 54% growing, \$3,182 median
- Customer Support — n=28, 57% growing, \$4,275 median
- SaaS-general (vertical, not horizontal) — largest revenue pool, above-median momentum

EMERGING (watch, small n)

- Dev Tools — best momentum in dataset (59%), still small revenue pool (\$484K)
- Fintech — 47% growing, n=19, too thin to size conviction yet
- Problem-level read: B2B outreach / CRM text-cluster is the single largest revenue pool found in problem-statement analysis, with 55% growing — corroborates the Sales/Analytics signal independently

WATCH / AVOID

- Mobile Apps — 12% growing on n=124; clearest saturation signal in the data
- Generic AI content tools (writing/image/video) — #2 revenue by volume but below-median momentum (37%); matches text-cluster finding of high revenue, weak growth
- Content Creation — same pattern: high supply, flat momentum

LIMITS Self-selected, single-snapshot marketplace data; no TAM, team or moat inputs. Use to prioritize diligence targets and sourcing focus — not as a standalone allocation decision.
