

TrustMRR: Unlocking the Startup Ecosystem

An analysis of 1,000 startups—mapping revenue, geography, categories, and the mechanics of monetization.

A high-resolution snapshot of ecosystem performance.

Scale

1,000 Startups
29 Variables

Spanning identity, geography, traffic, MRR, audience, and valuation.

Economic Value

\$15.60M

(30-day Revenue)

\$13.47M

(Total MRR)

The Core Questions

- > Where are they built?
- > How do they monetize?
- > What characteristics drive top-tier performance?

Transforming raw data into structured business intelligence.

Geographic startup volume does not guarantee revenue concentration.

Startup Concentration (Count)

Revenue Concentration (\$)

The US accounts for **>25% of startups** but commands an overwhelming majority of the **economic value** (\$9.84M).

Key Insight: A market can have high startup volume without equally strong revenue performance. Distinguish between where companies are built and where economic value is generated.

AI dominates the ecosystem, but smaller categories reveal high efficiency.

Nearly 1 in 5 companies is classified as AI, leading in both volume and total revenue.

Key Insight: Evaluate category performance through a combined formula: Scale + Revenue + Typical Company Performance, rather than company count alone.

Stripe holds a monopoly on both startup preference and economic throughput

It is crucial to define the metric before interpreting infrastructure dominance.

We must ask both "What is most popular?" and "What processes the most capital?"

Key Insight: In this dataset, Stripe wins decisively on both measures.

The B2B model yields a 4x multiplier in average company revenue.

B2B

Volume: 255 Companies

Total 30-day Revenue: \$5.77M

Average Revenue/Company:

~\$22,638

Mechanics: Higher ticket sizes, enterprise subscriptions, larger contracts, recurring SaaS.

B2B average revenue is ~4x higher.

B2C

Volume: 401 Companies

Total 30-day Revenue: \$2.29M

Average Revenue/Company:

~\$5,723

Mechanics: High volume dependencies, lower individual price points.

Note: This demonstrates a statistical association in the TrustMRR dataset, not proof of causation.

Ecosystem revenue is not democratized; it follows a severe long-tail distribution.

10% of the companies account for nearly 84% of all observed revenue.

When outliers drag the average upward, standard math becomes misleading.

The Metric Mapping Legend

Use SUM for total economic contribution.	Use AVERAGE for revenue per company.	Use MEDIAN for typical company performance.	Use COUNT for sheer volume.
---	---	--	------------------------------------

The underlying anatomy of revenue generation.

$$\text{Revenue} \approx \text{Paying Customers} \times \text{Revenue per Customer}$$

30-Day Revenue (\$)

X-Axis: Active Subscriptions

Synthesis

Moving from descriptive data ('what it looks like') to behavioral data ('what moves together').

Variance Note

The correlation is strong but imperfect. The variance (scatter off the line) represents divergent pricing strategies, customer segments, and subscription tiers.

The Stealth Giants: Anonymity is not a proxy for early-stage performance.

Named Startups

870 Companies (87%)

\$11.40M Revenue (73.1%)

Average Revenue: ~\$13,109

Anonymous / Stealth

130 Companies (13%)

\$4.19M Revenue (26.9%)

Average Revenue: ~\$32,244

Startups listed as 'Blank', 'Stealth Company', or 'Hidden Business' generate nearly 2.5x the average revenue of named companies.

Key Insight: In the TrustMRR dataset, anonymity often **shields highly lucrative, top-performing operations.**

The Blueprint of the Startup Ecosystem
