

TRUSTMRR MARKETPLACE

Where revenue moves fastest, and what buyers actually pay for

Revenue momentum, audience economics, pricing power, geography, and exit value across 1,000 indie SaaS, AI, and app businesses

The market is small on average, and wildly uneven

Most companies are modest; a handful of outliers carry the whole distribution

1,000

companies profiled

\$1,036

median monthly revenue

26%

currently listed for sale

\$3.6M

revenue of the single largest company

Where the 1,000 companies fall on monthly revenue

Reading the shape

Two out of three companies make under \$5,000 a month. The average is dragged up by a thin tail of large earners — so every category comparison ahead uses the median, not the mean.

Dev Tools is the quickest category to revenue

Share of companies that grew revenue in the last 30 days, by category (15+ companies)

57%

of Dev Tools companies grew revenue last month
— median +6.4%, best of any category

23%

of Mobile Apps companies are growing — the
slowest category, despite having the most
subscribers per company

B2B companies earn nearly 6x more than B2C

Median monthly revenue, subscribers, and growth by who the product is sold to

B2C has 57% more companies than B2B in this dataset — but headcount doesn't translate to revenue. Selling to businesses is the single strongest lever in this data, stronger than category choice alone.

Revenue level and growth rarely move together

Median monthly revenue vs. share of companies growing, bubble size = number of companies

Cash cows

Education, Marketing — high revenue, steady growth

Rising fast

Dev Tools, Analytics — modest revenue, best growth

Crowded

AI — huge headcount, low revenue per company

Commodity

SaaS, Mobile Apps — large, low growth

Pricing power varies more than customer count

Median monthly revenue per subscriber, by category (15+ companies)

\$53.80

per subscriber for Marketing tools — the strongest pricing power of any category, roughly 13x Health & Fitness

\$4.10

per subscriber for Health & Fitness apps — solid subscriber counts, but a high-volume, low-price model

Buyers price momentum lower than they price size

Median asking price, as a multiple of annual revenue, for companies listed for sale

~4x

annual revenue is what buyers pay for Education and Marketing businesses — the richest valuations in the dataset

1.2–1.4x

is all SaaS and Dev Tools command — the lowest multiples, even though Dev Tools has the fastest revenue growth of any category

The same product monetizes very differently by market

Median monthly revenue by country (15+ companies)

\$1,263

median monthly revenue in the US — the clear leader, well ahead of every other market

\$6

median monthly revenue in India, despite 59 companies — the largest headcount-to-revenue gap in the dataset

Followers don't predict revenue. Search authority does.

Correlation of each metric with monthly revenue, across all companies with data

0 = no relationship · 1 = perfectly predictive

What this means

A company's Domain Rating — a measure of how much other sites link to and trust it — is more than twice as correlated with revenue as its X follower count.

Social following is a weak signal on its own: plenty of low-follower companies earn well, and plenty of high-follower ones earn little. Being findable through search appears to matter more than being followed.

Which categories are worth building in

Reading revenue, momentum, pricing power, and exit value together

1 Education

Most viable

Highest revenue, richest exit multiple (3.95x), most loyal base (118 subs, median).

2 Marketing & Analytics

Healthy & interesting

Strong revenue, best pricing power (\$54/subscriber), growth above 50%, multiples near 3.4–3.7x.

3 Dev Tools

Undervalued momentum

Fastest-growing category by far, but the lowest exit multiple (1.35x) — not yet priced in.

4 AI

Crowded, not concentrated

1 in 5 companies in the dataset, but median revenue is just \$446/mo. Hype outpaces payoff.

5 Sell to businesses

Strongest single lever

B2B beats B2C by ~6x in median revenue — audience may matter more than niche.

6 SaaS, Mobile Apps, Productivity

Commodity

Large populations, weak growth, weak multiples, weak pricing power — hardest to stand out in.

Read these findings with a few limits in mind

1

30 days is a snapshot, not a trend

Growth figures reflect one month. A single strong or weak month can swing a small category's numbers.

2

Category is unlabeled for 274 companies

Over a quarter of the dataset has no category tag and isn't reflected in the comparisons above.

3

Smaller categories and countries carry wider margins

Groups like Fintech, Social Media, or Australia rest on 15–20 companies — a few outliers move the median.

4

Self-reported revenue fields don't always reconcile

12-month revenue is occasionally lower than the monthly rate implies, and subscriber counts may include free tiers.

The takeaway

Dev Tools moves fastest. Education pays best. Selling to businesses beats picking the trendiest category.

Momentum: Dev Tools grows fastest but is priced like a slow category.

Value: Education and Marketing command the richest exits.

Audience: B2B outearns B2C by ~6x, regardless of category.

Signal: search authority predicts revenue far better than social following.
