

Investment screen: revenue quality beats category hype

Recommendation-oriented analysis of 1,000 TrustMRR listings across category, audience, SEO, pricing, seller risk and acquisition multiples.

B2B

primary monetization filter

SEO

strongest observed revenue signal

Enterprise

best traffic monetization model

Education

best median MRR category

Core thesis: prioritize businesses with durable demand capture and paid-value extraction, not categories with the highest listing volume.

Final investment stance: target B2B Education-led assets with strong Domain Rating and Enterprise / Contact Sales pricing; use category multiples as valuation discipline.

Built for investment recommendation: what to buy, what to diligence, what to avoid overpaying for.

Education has the best revenue quality — AI has the most noise

\$2,142

median MRR in Education

380%

Education premium
vs AI median MRR

Investment read: Education is the category to prioritize for operating cash-flow quality. AI has 197 listings, but median MRR ranks mid-pack — high supply does not equal investability. Use category volume only as sourcing breadth; screen quality with MRR, growth, pricing and moat metrics.

Buy revenue quality, not market buzz: Education is the strongest category screen in this dataset.

B2B is the clearest monetization filter for investability

5.7x

higher median MRR: B2B vs B2C

p < 0.05

statistically significant
Mann-Whitney result

Median B2B MRR is \$1,036 vs \$181 for B2C — a step-change in monetization. The difference is statistically significant, reducing the chance this is random sampling noise. Investment read: B2B should be a first-pass filter before category selection.

Prioritize B2B assets even inside attractive categories; B2C needs exceptional growth or CAC evidence.

Domain authority is the strongest observed revenue signal

$r = 0.53$

Domain Rating correlation with revenue

$p < 0.0001$
highly significant relationship

Domain Rating has the strongest observed relationship among variables tested; this is correlation, not causation. It outperforms social following and better reflects durable, lower-CAC demand capture. Investment read: organic search strength is a diligence priority, not a secondary marketing metric.

A strong SEO moat should command more confidence than vanity metrics like follower count.

Enterprise pricing monetizes traffic far better than Freemium

36x

higher revenue per visitor vs
Freemium

\$4.69

Enterprise / Contact
Sales revenue per visitor

This is revenue per visitor, not conversion rate — the signal is monetization efficiency. Freemium may increase adoption, but it underperforms sharply on value capture. Investment read: prefer assets that sell value, not just usage.

Enterprise / Contact Sales pricing is a positive signal for pricing power and buyer ROI.

For-sale businesses are not statistically proven to be weaker

p = 0.16

Welch t-test on MRR growth difference

10.1%

mean growth for for-sale listings

Mean growth is lower for for-sale listings, but the difference is not statistically significant. This does not prove “no adverse selection”; it means the dataset does not show strong evidence of it.

Investment read: do not reject for-sale assets automatically — diligence growth durability instead.

Buyer fear is not enough to screen out sellers; validate churn, retention, traffic sources and owner dependency.

Category affects acquisition pricing — Sales gets the richest multiples

6.4x

median revenue multiple for Sales

0.8x

median revenue multiple for Games

Sales businesses command the highest observed median revenue multiple; Games sit at the bottom.

This is a valuation benchmark, not proof of category impact independent of revenue or growth.

Investment read: valuation discipline matters — attractive revenue categories can still be poor buys if entry multiple is too high.

Use category multiples to avoid overpaying; combine operating quality with entry-price discipline.

Invest in B2B, SEO-led, enterprise-priced Education assets — at disciplined multiples

Recommended target profile

SCREEN	INVESTMENT RULE	WHY IT MATTERS
Category	Education-first; Sales only if priced rationally	Revenue quality + valuation awareness
Audience	B2B over B2C	5.7x median MRR advantage
Moat	High Domain Rating / organic search depth	Strongest observed revenue relationship
Pricing	Enterprise / Contact Sales preferred	36x revenue per visitor vs Freemium
Risk	Do not reject for-sale assets by default	No statistically significant growth gap
Price	Benchmark against category multiples	Avoid paying “Sales-like” premium for weak fundamentals

Investment action

1. Prioritize: B2B Education businesses with strong SEO and Enterprise / Contact Sales pricing.

2. Diligence: retention, owner dependency, traffic concentration, churn, MRR quality and CAC payback.

3. Avoid: high-volume categories with weak MRR, Freemium-heavy monetization, low Domain Rating and stretched multiples.

Conclusion: the most investable asset is not simply “AI” or the most popular category. It is a revenue-dense B2B business with SEO-driven demand and proven pricing power.

- BUY QUALITY
- DILIGENCE MOAT
- PRICE DISCIPLINE
- AVOID HYPE
- FOCUS ON MRR
