

A market of a few big winners, and a very long tail

Across 1,000 tracked startups, revenue scale, category mix, and geography all point the same way: a handful of standout businesses carry the market, while most listings are still small and early.

\$400

Median 30-day revenue per business

\$15.6K

Average 30-day revenue (mean, skewed by top earners)

61%

Share of all-time revenue held by the top 10 businesses

10%

Of listings have earned \$0 all-time revenue

WHERE THE LISTINGS SIT (by category)

WHERE THE LISTINGS ARE (by country)

A market split three ways — and running below early-stage norms

30-DAY REVENUE MOMENTUM (986 businesses reporting)

Roughly 1 in 3 businesses shrank in the last 30 days, 1 in 3 held flat, and 1 in 3 grew — an even three-way split rather than broad-based momentum.

HOW THIS COMPARES TO INDUSTRY BENCHMARKS

- 1 This dataset (typical business)**
Flat median growth; 1 in 3 declining
- 2 Bootstrapped SaaS, all stages (SaaS Capital, 2025)**
~23% annual growth, median
- 3 Early-stage B2B SaaS, <\$1M ARR (2025 SaaS Benchmarks Report)**
~75% annual growth, median
- 4 Early-stage annual churn benchmark (KeyBanc 2025 survey)**
~8–10% logo churn / year

Note: the dataset skews toward very small, early-revenue businesses (median \$282 MRR), so the fairest comparison is the early-stage (<\$1MARR) benchmark row — and most listings are running well under it.

MRR checks out for most businesses:

for a typical business, monthly recurring revenue and actual 30-day cash revenue line up almost exactly (median ratio 1.02). But 15% of businesses show a 2x+ mismatch between the two — usually a sign of one-off or annual payments sitting alongside the subscription base.

TAKEAWAYS

What the data means for anyone buying, selling, or building here

1

Scale is rare — don't average it away

The gap between median (\$400/mo) and average (\$15.6K/mo) revenue is ~39x. A handful of businesses like Stan, Rezi, and several unnamed "stealth" listings carry the market; most benchmarks should use the median, not the mean.

2

Crowded ≠ lucrative

AI is the most-listed category (27% of all businesses) but sits mid-pack on revenue. Smaller categories — Education, Content Creation — show noticeably higher median revenue per business despite far fewer listings.

3

Growth is stalling for a third of the market

34% of businesses lost revenue in the last 30 days, and the overall pace trails typical early-stage benchmarks (~75%/yr) by a wide margin — worth flagging before treating growth claims at face value.

4

The resale market is active but small-ticket

262 of 1,000 businesses (26%) are listed for sale, at a median asking price of \$35,000 — this is a marketplace of small, founder-run assets, not large-scale acquisitions.

WHERE TO BUILD

The whitespace sits away from the crowd

REVENUE PER LISTING, ADJUSTED FOR HOW CROWDED THE CATEGORY IS

A simple ratio computed from this dataset (median 12-month revenue ÷ number of listings in the category) — not an external benchmark. Sales and Social Media rank highest but rest on small samples (n=13 and n=18); treat as directional.

THREE PLACES WORTH LOOKING FIRST

1 Education or Content Creation

Highest median revenue among categories with a meaningful sample (n=30 and n=36), ~39–40% of businesses still growing, and far less crowded than AI (197 listings).

2 A B2B audience over B2C

B2B businesses post \$8,362 median 12-month revenue vs. \$2,213 for B2C — a 3.8x gap — while listing counts are comparable (255 vs. 401). Who you sell to matters as much as what you build.

3 Marketing or Analytics as a fast-follow niche

Smaller categories, but the highest share of businesses actively growing right now (50% and 53% vs. 35% for AI) — a momentum signal worth watching.

Where to be cautious: AI (197 listings, only mid-pack revenue) and Mobile Apps / Productivity (crowded, and the weakest revenue and growth of any major category).

What this dataset is actually describing

This is a nano-business market, not a SaaS unicorn pipeline

Median MRR across all 1,000 listings is \$282. The vast majority are pre-scale, founder-run products — the outliers (Stan, Rezi, a few stealth listings) are the exception, not the rule.

Popularity and profitability are two different signals

AI draws the most builders (27% of listings) but ranks 8th of 12 sized categories on median revenue. Chasing the crowd doesn't reliably chase the money.

Slowdown is real, but it's not evenly spread

A third of businesses lost revenue this month, yet growth concentrates in specific pockets — Analytics, Dev Tools, Marketing, and B2B audiences broadly — so "the market is slowing" is true on average and false in several corners.

Trust the revenue figures; verify before trusting the rest

Revenue fields are internally consistent and Stripe-sourced for most rows. MRR is reliable for ~85% of listings but mismatches for the rest, and the revenue_multiple field showed no real relationship to asking price — don't use it for valuation as-is.

NEXT STEPS

What to do with this, in order

A practical sequence — whether you end up building something new or buying one of the 262 listings currently for sale.

1

Shortlist a niche, don't chase the crowd

Start from Education, Content Creation, or a B2B angle within a category you already understand — then validate with 10–15 real customer conversations before writing code or making an offer.

2

If buying, underwrite the numbers yourself

Pull each listing's 30-day revenue and MRR side by side — walk away if they're off by more than 2x. Ignore the revenue_multiple field; it showed no real link to asking price in this data. Median ask across the market is \$35,000.

3

Set your growth bar from the right benchmark

Early-stage businesses in this range should be aiming for roughly 10–15% month-over-month growth, not the flat median this dataset shows today — use that as your target, not the market average.

4

Track revenue and subscriber count together, not MRR alone

MRR under-reported real cash performance for about 15% of listings here. Reviewing 30-day revenue and active subscriptions alongside it catches that gap early.

5

Refresh the analysis before you commit

This dataset is frozen as of July 30, 2026. Re-pull the numbers for your shortlisted niche or listing right before a final go/no-go decision.
