

REVENUE CONCENTRATION

Who Actually Earns the Money?

A power-law read of 30-day revenue across 1,000 indie & micro-SaaS startups

Business Analysis · TrustMRR Dataset (n = 1,000) · Frozen 30 Jul 2026

THE SHAPE OF THE MARKET

83.7% of Revenue Sits in Just the Top 10% of Startups

49.6%

of all revenue earned by just the top 10 startups

21.6%

of the 1,000 startups earned \$0 in the last 30 days

\$400

median 30-day revenue — vs. a mean of \$15,596

THE WHALES

A Handful of Startups Set the Market's Ceiling

READING THE PATTERN

- ▶ Startup #1 (Stan) alone earns more than startups #2 through #6 combined.
- ▶ The drop-off from #1 to #10 is steep, then the curve flattens fast — classic power-law, not a normal bell curve.
- ▶ This means the 'average' startup in this dataset is not a useful benchmark; the median (\$400/30 days) is far closer to reality than the mean (\$15.6K).

SO WHAT

Implication: Benchmark and Segment, Don't Average

Don't use the mean

Any KPI or valuation built on 'average revenue' will be skewed by ~10 outliers. Use median and percentile bands instead.

Segment before comparing

A meaningful peer set is 'startups within your revenue decile,' not 'all 1,000 startups.' Cross-decile comparisons mislead.

Watch the zero-revenue tail

1 in 5 tracked startups show \$0 revenue. Before drawing market conclusions, confirm whether this is true dormancy or a tracking gap.
