

TRUSTMRR

The Database of Verified Startup Revenue

Company overview, dataset insights, and business impact — built from a frozen 1,000-row snapshot of the platform
(30 Jul 2026)

Prepared for Kaelor Capital

What Is TrustMRR

A transparency-first alternative to inflated revenue screenshots

1

Founded by indie hacker Marc Lou

Launched to promote the "build in public" movement among bootstrapped founders.

2

Revenue is verified, not self-reported

Every figure is pulled directly via read-only API keys from Stripe, LemonSqueezy, Polar, RevenueCat, Superwall, and Creem.

3

Hourly data refresh

MRR and growth numbers update automatically from live payment-provider APIs, not manual entry.

4

Dual-purpose platform

A public leaderboard for credibility and discovery, plus an active marketplace for buying and selling startups.

PLATFORM AT A GLANCE

\$1.5B+

Verified revenue tracked across the platform

840+

Startups listed with verified metrics

200K

Monthly visitors browsing for acquisitions

54M

Verified transactions underlying the data

Our Dataset: A Frozen Snapshot

1,000 companies pulled from TrustMRR and frozen on 30 Jul 2026 for consistent analysis

1,000

Companies in the dataset

29

Data fields per company

28

Categories represented

16

Payment-provider combinations

What the dataset captures

- ▶ Revenue: 30-day, 3-month, 12-month, and all-time (USD)
- ▶ MRR and MRR growth, active subscriptions, visitors, revenue per visitor
- ▶ Country, category, audience type, payment provider(s)
- ▶ Marketplace status: on-sale flag, asking price, revenue multiple

Why this matters for diligence

Because every revenue figure is API-verified rather than self-reported, this dataset behaves like a real deal-sourcing feed — closer to what an IB analyst pulls from a data room than a survey. That makes the patterns below directly usable for screening, pricing, and outreach targeting.

Revenue Leaders: Country Comparison

Total 30-day revenue across four benchmark markets

KEY INSIGHT

Hong Kong is more than 2x Poland

HK generates \$210,071 in 30-day revenue across 19 companies — outpacing Poland (\$90,150), Estonia (\$68,262), and Turkey (\$51,998) combined by a wide margin.

Business impact: HK-based indie SaaS looks like the deepest single-market pocket of the four for sourcing acquisition or investment leads — worth prioritizing in outreach sequencing.

Payment Rails: Provider Revenue

Total 30-day revenue for four exact payment_provider configurations

KEY INSIGHT

Whop-only checkout wins on revenue density

Just 7 companies use Whop as their sole payment provider, yet together they generate \$50,661 in 30-day revenue — more than the 3-company Stripe+RevenueCat cohort (\$36,630).

Business impact: per-company revenue density on Whop is high, hinting at community/membership products with strong monetization — a useful signal when screening for deal quality.

Category Economics

Two category-level cuts that shape where value concentrates

HEALTH & FITNESS

\$178,607

total 30-day revenue across 34 companies

Health & Fitness is a broad, high-volume category — the revenue is spread across a large founder base rather than concentrated in a handful of breakout players.

Impact: strong category for volume-based sourcing (many small-to-mid deals) rather than single marquee acquisitions.

FINTECH

\$500

median MRR (n=16, zeros included, blanks excluded)

A \$500 median MRR against a spread that runs up to \$21,353 shows Fintech is barbell-shaped: a handful of scaled winners next to many early-stage, pre-revenue-scale entrants.

Impact: Fintech deal flow needs stage-based filtering — the median understates what the top of the category is actually worth.

The Transparency Premium

Named companies vs. anonymous listings, by all-time revenue

KEY INSIGHT

Named founders out-earn anonymous ones ~4.6x

Companies with a disclosed name and founder identity account for \$274.5M in all-time revenue, versus \$59.6M for listings marked blank, "Stealth Company," or "Hidden Business."

Business impact: public identity correlates strongly with scale on this platform — brand transparency isn't just a trust signal, it tracks with revenue maturity. For deal sourcing, named listings are the higher-confidence pool.

A Cautionary Signal: Games

Revenue per visitor — Games vs. SaaS

KEY INSIGHT

Games monetizes traffic ~216x worse than SaaS

Games earns \$0.03 per visitor on average vs. \$6.49 for SaaS. Total 30-day Games revenue is \$75,924, median MRR is just \$262, and only 4 Games companies are listed for sale.

Business impact: high follower or visitor counts in Games are not a reliable proxy for revenue. Any inbound deal pitch built on traffic size alone needs monetization diligence before it's taken seriously.

What This Means For Deal Sourcing

Five takeaways from the frozen TrustMRR dataset

- 1 Hong Kong is the deepest of the four benchmarked markets — over 2x Poland's 30-day revenue.
- 2 Whop-only checkout setups show the highest per-company revenue density among providers compared.
- 3 Named, transparent founders out-earn anonymous listings by ~4.6x in all-time revenue.
- 4 3-month revenue is a weak predictor of current MRR ($r = 0.145$) — don't underwrite on it alone.
- 5 Games' traffic doesn't convert — diligence monetization, not just audience size, before engaging.
