

TRUSTMRR DATASET ANALYSIS

Revenue Concentration & Monetization Drivers

A cross-sectional analysis of MRR, audience metrics, and conversion efficiency across 1,000 bootstrapped SaaS and consumer ventures

Revenue Distribution Overview

n = 1,000; monetization is right-skewed and heavy-tailed, consistent with a Pareto-type distribution

1,000

companies in sample

80%

report MRR > \$0

\$282

median monthly MRR

20%

report \$0 MRR

Revenue concentration (Pareto structure)

Mean MRR (\$13,471) exceeds median MRR (\$282) by ~48x — a small number of high-revenue outliers dominate the aggregate; median is the more representative central-tendency measure here.

Revenue Leaders vs. Monetization Laggards

Top-decile concentration on the left; two distinct failure-to-monetize patterns on the right

Top earners by MRR

Predominantly B2B / prosumer tools with seat- or usage-based pricing

1

Pattern 1: audience-revenue disconnect

29 companies (of n=259 with >500 X followers) report \$0 MRR — an 11% conversion-failure rate within this cohort despite established distribution.

e.g. Stealth Co. (SaaS, 366K followers) · Stalkr (AI, 362K followers)

2

Pattern 2: revenue attrition

15 companies with >\$50K lifetime revenue now report ≤\$100/month MRR — evidence of churn to zero, not pre-revenue status.

e.g. Eloking (E-comm): \$1.33M lifetime → \$0/mo current

Category-Level Monetization Performance

Median monthly MRR by vertical, restricted to categories with n≥8 to control for small-sample noise

Analytics & Sales: near-universal conversion

100% of companies in these categories report MRR > \$0 — buyers have pre-existing budget authority and clear ROI justification.

AI: scale without unit economics

n=197, \$1.8M combined MRR — the largest total revenue pool of any category, but the lowest per-company median (\$446).

Audience Scale vs. Monetization Efficiency

Traffic and follower growth are weak predictors of revenue conversion in this sample

Revenue per visitor

67%

of companies with 1,000+ followers show flat or declining MRR over the trailing 30 days

Statistical interpretation

- Follower count correlates weakly with MRR (Spearman $\rho = 0.30$) — materially weaker than visitor volume ($\rho = 0.51$) or domain authority ($\rho = 0.46$)
- Owned/search traffic converts at a higher rate than social-referred audience
- Large followings tend to be attention-based rather than purchase-intent-based

Secondary Explanatory Variables

Buyer type and payment infrastructure show a stronger association with MRR than audience size

B2B premium

B2B earns 5.7x B2C at the median despite comparable monetization rates (89% vs. 85%).

Payment infrastructure effect

Superwall-integrated apps (mobile paywalls) monetize at 100%; lighter-weight providers trail materially.

3

Listed-for-sale ≠ distressed asset

\$1,055

median MRR — companies listed for sale

\$187

median MRR — companies not listed

Consistent with an adverse-selection dynamic in reverse: owners appear to list once revenue is proven, not to offload non-performing assets.

CONCLUSION

Monetization is a function of buyer type and purchase intent — not audience scale.

Categories sold to buyers with a defined budget line — Analytics, Sales, Marketing, Education — monetize near-universally and at materially higher price points. Consumer- and audience-driven categories frequently show traffic or followings that fail to convert, and the incidence of this pattern (67% of large-audience companies flat or declining) is high enough to indicate a structural relationship rather than isolated cases.

LIMITATIONS & SUGGESTED FURTHER ANALYSIS

- Do the 29 high-follower, zero-revenue companies lack a paid tier entirely, or is this a pricing/positioning gap?
- For the 15 companies exhibiting revenue attrition, does the decline correlate with a pricing, platform, or payment-provider change?
- Is AI's low per-company MRR a category effect, or a cohort-age effect (newer listings, less time to convert)?
