

A workflow is a promise
about what happens next.

Put these in order

approval
requested

lead received

follow-up
drafted

duplicate found

input validated

Which event must never happen twice?

One lead, two promises

Same webhook. Same email. Two CRM rows. Two drafts.

What failed?

01 **Make**

02 **The modules**

03 **The design**

Retries are normal. The design allowed action before duplicate check.

Automation is state, not spaghetti

If you cannot name the states, you cannot control the system.

The six-box contract

Put the brake before the cliff

Before money, messages, deletion, publishing, or customer status changes:

Choose one operating problem

GTM

**route a lead without
duplicates**

OPERATIONS

**contain and escalate
an exception**

REVENUE

**reconcile expected and
actual money**

Default to GTM if time or confidence is low.

08 : 00

START · VALIDATE · DEDUPE · DECIDE · ACT/QUEUE · RECORD · END

Every path must land

CASE	MUST END AS
normal	completed or safely queued
duplicate	no second irreversible action
malformed	quarantined with reason
timeout	retrying/incomplete, then resolved or manual
approval	pending; no action yet

Gate 1

Submit the problem frame + initial flowchart.

02:00

Read feedback like an operator

- 01 Find the cited node.
- 02 Decide whether the risk is real.
- 03 Accept, adapt, or reject.
- 04 Record why.

05 : 00

What could create money, message a human, or corrupt a record twice?

Change log

ADVICE	DECISION	EVIDENCE
Add duplicate state	Accepted	before queue/write
Retry malformed data	Rejected	retry cannot repair input

Record at least one accepted/adapted and one rejected/not-applicable suggestion.

Build only the spine

Classroom substitutes, not production architecture.

Normal is the first test, not the last

```
trace_id: trc_s5_normal_001  
route: warm · final state: drafted  
outbound sends: 0
```

Show the audit row and draft / queue artifact - not green bubbles alone.

08:00

- ✓ trigger accepts fixture
- ✓ required fields mapped
- ✓ trace_id retained
- ✓ scheduling off

08 : 00

- ✓ idempotency key computed
- ✓ existing key searched before write/action
- ✓ fallback route exists
- ✓ owner named

09 : 00

- ✓ normal case passes
- ✓ audit row/output created
- ✓ run trace visible
- ✓ screenshot not yet taken

The gauntlet

Predict → Run → Observe → Repair once

DUPLICATE

MALFORMED

TIMEOUT

APPROVAL

Expected results stay hidden until predictions are submitted.

Four ways to be wrong

DUPLICATE

Was a second action possible?

MALFORMED

Did it stop safely with a reason?

TIMEOUT

Was state retained for retry or manual recovery?

APPROVAL

Could anything irreversible happen while pending?

Private evidence. Public clone.

PRIVATE BLUEPRINT JSON	OFFICIAL MAKE SCENARIO LINK
point-in-time evidence	latest saved version
import privately	official view / sign-in copy
under 2 MB	public clone surface
connections recreated	connections recreated

Raw blueprint stays private. Use an official Make link—or withhold cloning.

The evidence bundle

- 01 revised flowchart
- 02 blueprint JSON
- 03 redacted run log
- 04 sample output
- 05 workflow PNG
- 06 limitation + change note

Blueprint = private · official Make link = optional public clone
