

Session 3 · Offline execution lab

This no-notebook route has the same score ceiling. It runs the full gzip JSONL locally and writes only compact output plus an audit trace.

Privacy: keep the data and output in the section's private folder. Do not attach rows to a personal AI workspace or publish the output.

1 · Verify the pack

Compare the dataset version and SHA-256 with the LMS/offline manifest. Stop on any mismatch.

2 · Open a terminal in this folder

```
python -m pip install --require-virtualenv pandas==3.0.0
python session-03-local-runner.py \
  --input trustmrr_s3_peer_comparisons_v1.jsonl.gz \
  --output session-03-scale-output.csv \
  --trace session-03-scale-trace.json \
  --dataset-version trustmrr-s3-v1 \
  --expected-sha256 <SHA-256-FROM-MATERIAL-CARD>
```

3 · Read checks before results

The command must print PASS. Open the private trace and confirm checksum, assertions, valid/excluded counts, and runtime version before using the aggregate.

4 · Verify independently

Recompute one bounded result with a pivot, formula, or a second implementation. A second prompt to the same model is not independent.

5 · Submit after service returns

Upload the numbered answer sheet, runner/code, compact CSV, and trace. Never upload the full peer file as evidence.
