

1,000 STARTUPS, ONE MARKETPLACE

What TrustMRR reveals about bootstrapped SaaS

1,000

startups listed

65

countries represented

\$13.5M

combined monthly recurring revenue

AI dominates headcount, not wallet share

- AI is the largest single category: 197 of 1,000 listings (19.7%) — more than 3x the #2 category.
- But AI captures only 13.4% of platform-wide MRR — volume leadership does not translate to value leadership.
- 27.4% of listings carry no category tag at all, concentrated among anonymized “Stealth” entries.

Smaller categories and markets win on revenue density

Bars above the 1.00 fair-share line (left) and the high-efficiency markets Singapore, Hong Kong, UAE, and Estonia (right, highlighted) earn more revenue than their listing share alone would predict — the U.S. leads on both volume and efficiency.

Freemium is the default playbook — but B2B converts harder

52.7%

of listings with a stated pricing model offer a free tier or trial

55.0%

use multi-tier pricing (2+ price points) rather than a single flat price

47.5%

bill monthly — the dominant cadence vs. annual (8.5%) or weekly (2.4%)

Median MRR by audience type (\$)

5.7x

higher median MRR for B2B vs. B2C startups — the same gap holds for revenue-per-active-subscriber (\$83 vs. \$13).

Stripe is the standard rail — and revenue follows it

Share of platform 30-day revenue, by primary payment provider

- Stripe alone powers 64.4% of listings and captures 87% of platform 30-day revenue — adoption and monetization both concentrate on one rail.
- RevenueCat is a distant #2 (19.1% of listings, 8% of revenue) — the clear signature of a native mobile-subscription subsegment.
- The remaining seven providers combined capture under 5% of revenue — a fragmented, low-value long tail.

This is a power-law market, not a bell curve

Startups by monthly recurring revenue tier

\$282 vs. \$13,472

median MRR vs. mean MRR across all 1,000 listings — a ~48x gap driven by a handful of outliers (the top listing alone does \$3.57M MRR).

10.1% of listings report \$0 all-time revenue; roughly a third of the marketplace is pre-revenue or hobby-scale. Every category and country claim in this deck is median-based to avoid outlier distortion.

Underserved value, not crowded volume

Avoid AI-for-AI's-sake

the most crowded, least revenue-efficient category (efficiency index 0.68 despite 197 listings).

Default to B2B over B2C

5.7x higher median MRR and 6x higher revenue per subscriber, independent of category.

Prefer efficiency-index leaders

E-comm, Education, and Analytics all convert listings into revenue above the 1.00 fair-share line.

Look past the US/UK default

Singapore, Hong Kong, UAE, and Estonia show outsized revenue-per-listing on small footprints.

This is a snapshot of listed businesses, not a controlled study — selection and survivorship bias in what gets listed on TrustMRR should temper how hard any single conclusion is pushed.
