

TRUSTMRR DEEP DIVE · 1,000 PRODUCTS ANALYZED

Inside TrustMRR

Why the Average Product Doesn't Matter

A data-driven case for what actually separates the winners from the other 900 — and what it means before we start our next project.

1,000

products in the sample

\$13.47M

combined monthly recurring revenue

\$133.75M

trailing 12-month revenue

The Premise

- TrustMRR lists real indie and small SaaS products alongside their live revenue data — not projections, actual reported MRR.
- This deck analyzes 1,000 listed products: a large enough sample to see real patterns, not cherry-picked outliers.
- The question we're really asking: if we start a project, what does this market actually reward — and what does it punish?

1,000

29
product categories

65
countries represented

9
payment gateways in use

A \$13.47M-a-Month Ecosystem

On paper, this looks like a thriving market. The next slide asks whether it's shared — or captured.

\$13.47M

Combined monthly recurring revenue

\$133.75M

Trailing 12-month revenue

\$334.0M

All-time reported revenue

1,000

Products generating it

The Concentration Reveal

One product holds more MRR than the bottom 900 combined.

26.5%
of ALL MRR sits in one product

48%
captured by just the top 10

82%
captured by the top 100 of 1,000

"TrustMRR looks like a marketplace of successful products. Statistically, it's mostly a museum of attempts."

Everyone's Building the Same Thing

AI dominates the labeled categories — but it's still a long tail beneath it.

The Biggest Category Has No Name

■ Uncategorized / "Stealth" ■ Labeled categories (29)

56.5% of all MRR

comes from listings marked "Stealth Company" or left uncategorized entirely.

Either the biggest winners are deliberately hiding what they build, or the visible category leaderboard is missing more than half the picture. Both possibilities matter.

So — is "AI is the winning category" even the real answer?

Everyone Uses the Same Rails

Stripe isn't just the most popular gateway — it's disproportionately where the real revenue lives.

A Third Aren't Really Monetized Yet

Reframe the dataset: not “1,000 successful products,” but roughly 650 with a real model, 350 still finding one.

Being listed on TrustMRR is not the same as having a proven business. Any “category of winners” conclusion should really be drawn from the 657, not all 1,000.

B2B Quietly Outperforms B2C

Fewer B2B products, more money each. The exciting consumer idea may not be the higher-value one.

255 B2B products earn more, combined, than 401 B2C products. Worth sitting with.

The Secondary Market Is Chaotic

262 of the 1,000 products are for sale — and there's no consistent pricing logic yet.

262

products currently for sale (26%)

\$86.8M

combined asking price

2.3x

median revenue multiple asked

0x – 327x

full range of multiples seen

Range of asking multiples (revenue multiple):

(positions illustrative — most listings cluster far below the max outlier)

No consistent formula means “build to flip” isn't reliable today — but a genuinely differentiated product could command an outlier multiple.

The Market Is “Growing.” Almost No One Is.

A big gap between median and mean only happens when a few outliers carry the whole average.

“The market is growing” is true and nearly meaningless. What separates the compounding minority?

Should We Start This Project?

A scorecard for translating seven acts of data into one go/no-go conversation.

Signal	What the data shows	Question to answer before we build
Category	AI leads visibly, but 56.5% of MRR is unlabeled	Do we compete in a crowded, visible space — or chase the blind spot?
Payment gateway	Stripe = 87% of MRR despite 64% of products	Is our stack a seriousness signal or an afterthought?
Monetization	Only 65.7% of listings have a real pricing model	Do we have a priced, sellable model before we build?
Audience	B2B: fewer products, more MRR per product	Are we chasing excitement (B2C) or economics (B2B)?
Growth benchmark	Median growth is 0%; mean is +33%	What would put us in the compounding minority, not the flat majority?
Exit multiple	262 for sale at 0x–327x, median 2.3x	Are we building for cash flow, for a sale, or both?

Build for the top 10%, not the market average.

This is a power-law market where the average product fails to matter. The visible winners cluster around AI, Stripe, and B2B with a real, disclosed pricing model — but over half the money is hiding in unlabeled “stealth” listings. Copying what's visible may just mean copying the crowded, already-obvious plays.

Go find out what the stealth companies are doing that we can't see.

Open Questions for the Team

- 01 *Do we build where AI is crowded but proven, or where categories are thin but unproven?*
- 02 *Is a Stripe-only stack a red flag of unambitious scope, or a green flag of seriousness?*
- 03 *What would it actually take to find out what the stealth companies are building?*
- 04 *Are we optimizing to be visible and comparable — or to be a genuine top-decile outlier?*
- 05 *If we can't clear a real, disclosed pricing model on day one, should we build at all?*

NEXT STEPS

From Data to Decision

01

Pull the stealth / uncategorized listings and hand-classify a sample

to see what's really driving 56.5% of the market's money.

02

Score any project idea against the Slide 12 framework

before scoping — category, gateway, pricing model, audience, growth bar.

03

Set a real growth benchmark to beat, not just “be live”

the median product is flat; only the compounding minority matters.

Thank you.
