qualitative fields

MICRO-SAAS ACQUISITION

Buying cash flow the market has mispriced

A quantified case for acquiring profitable, growing micro-SaaS businesses at 1–2× revenue, built entirely on verified payment-processor data rather than self-reported figures.

Prepared for investor discussion · Data frozen 30 July 2026

Five findings from 1,000 verified-revenue companies support a disciplined micro-SaaS acquisition strategy

- | | | |
|-----------|---------------------------------------|---|
| 01 | The supply is real and liquid | 262 of 1,000 companies were listed for sale at a single point in time — a continuously replenished deal pipeline. |
| 02 | Selection is the entire game | The top 1% of companies hold 49.6% of all revenue. Sourcing is trivial; identifying the survivors is not. |
| 03 | Sellers list into weakness | 39.7% of listings are declining, against 31.6% of companies not for sale — a persistent, exploitable adverse-selection gap. |
| 04 | The mispricing is structural | Multiples compress from 8.1× at the bottom to 1.5× at the top. Small sellers price on narrative, not arithmetic. |
| 05 | We have a signal others ignore | Domain authority predicts revenue three times better than social following — and it is public, free and checkable pre-LOI. |

One in four verified-revenue companies was for sale at a single point in time

EXHIBIT 1 · LISTING STATUS OF THE 1,000-COMPANY SAMPLE

■ Listed for sale ■ Not listed

262

companies actively listed for sale

\$35,000

median asking price — an individual-cheque market

2.3×

median asking multiple on trailing revenue

SO WHAT: Deal flow is not the constraint. At these price points the binding constraint is diligence capacity and selection discipline.

Revenue is so concentrated that a single mis-selection wipes out a portfolio of correct ones

EXHIBIT 2 · SHARE OF TOTAL 30-DAY REVENUE BY COMPANY DECILE

The distribution is a power law, not a bell curve

Averages are meaningless in this market — we underwrite on medians and on the specific asset only.

Half the sample earns 0.2% of the revenue between them. Most listings are not businesses; they are abandoned projects with a payment integration still attached.

SO WHAT: A strategy that buys the median listing loses. The thesis only works with a screen that rejects roughly 96% of what is offered.

Owners list when growth turns, so the average listing is a deteriorating asset

EXHIBIT 3 · SHARE OF COMPANIES WITH DECLINING REVENUE

31 of 65

listings above \$10k MRR — the ones large enough to matter — are shrinking at the moment they are offered.

Why this persists

- Solo owners lack the capital or appetite to fund a turnaround, so a declining month triggers the decision to sell.
- Marketplace listings display the multiple prominently and the growth trend barely at all.

SO WHAT: Adverse selection is the reason cheap assets stay cheap — and the reason a growth-positive filter is the single highest-value screen we apply.

Sub-scale sellers price on narrative; the arithmetic only appears higher up the curve

EXHIBIT 4 · MEDIAN ASKING MULTIPLE BY SELLER MRR BAND

Our entry band

\$1k–10k MRR clears at 2.3× — the cheapest point on the curve at which a business is large enough to survive an ownership transfer.

Both tails are traps

Below \$100 MRR, sellers ask 8.1× for what is effectively a domain name. Above \$100k, professional intermediation has already competed the multiple down to 1.45×.

SO WHAT: We concentrate between \$1k and \$10k MRR: priced by amateurs, ignored by institutional buyers, and large enough to service a transition.

Domain authority predicts revenue three times better than the signals most buyers rely on

EXHIBIT 5 · MEDIAN MRR BY DOMAIN RATING BAND

Rank correlation with MRR

Domain authority	0.49
Active subscriptions	0.90
X / Twitter following	0.17

Subscriptions correlate almost perfectly but are only visible after signing an NDA. Domain authority is public, free and checkable before we ever contact a seller.

SO WHAT: The screen runs on public data, so we can rank the entire market before competitors have finished reading the first listing.

The crowded categories are the poorest: hunt where entrants are few and revenue per company is high

EXHIBIT 6 · MEDIAN MRR BY MARKET CATEGORY

Target categories

Sales, Customer Support and Marketing tools: B2B buyers, contractual renewal behaviour, and the highest revenue per subscriber in the dataset at \$95–134.

Avoid

AI and Productivity carry the most entrants and the weakest per-company economics. AI is 27% of categorised companies but only 15% of revenue, and declines faster than the rest of the market.

SO WHAT: We are buyers of unglamorous B2B infrastructure and explicit non-buyers of consumer AI — the opposite of where competing capital is pointed.

Three business-model signals reliably mark assets we will not underwrite

EXHIBIT 7 · MEDIAN MRR BY PRICING STRUCTURE

PRICING STRUCTURE	SHARE	MEDIAN MRR	STANCE
Enterprise / negotiated pricing	7%	\$1,541	Buy
Paid trial, no free tier	8%	\$807	Buy
Usage or credit based	6%	\$598	Neutral
Annual discount offered	8%	\$326	Neutral
Open free tier	51%	\$160	Avoid
Lifetime / one-time deal	13%	\$124	Avoid

Why free tiers fail on acquisition

Half the market runs one, and it sits at the bottom of the revenue table. Serving unpaid users is a fixed cost a new owner inherits without the founder's tolerance for it.

Lifetime deals are a solvency signal: revenue was pulled forward, and the servicing obligation transfers to us with no cash behind it.

SO WHAT: Pricing structure is observable before contact, so two of our highest-conviction exclusions cost nothing to apply at the top of the funnel.

Five public-data filters reduce 1,000 companies to 10 qualified acquisition targets

EXHIBIT 8 · SCREENING FUNNEL, APPLIED TO THE FROZEN SAMPLE

99% rejection rate is the strategy, not a shortage of deals

SO WHAT: Ten targets from one frozen snapshot. The marketplace replenishes continuously, so this is a run-rate, not a one-off inventory.

WHAT THE SCREEN ACTUALLY FINDS

The ten qualified targets can be acquired in aggregate for roughly one times their combined annual revenue

EXHIBIT 9 · QUALIFIED COHORT, MEDIAN CHARACTERISTICS

\$150,000

median asking price

\$113,940

median revenue run-rate

1.2×

median asking multiple

+30.5%

median monthly revenue growth

35

median domain rating

10 of 262

listings that clear every filter

\$2.61M

to acquire all ten, against \$2.60M of combined annual revenue — an aggregate entry multiple of 1.0× on businesses growing at a median 30% a month.

SO WHAT: This is the whole thesis in one number: disciplined selection buys growing revenue at parity, in a market whose median listing asks 2.3× for declining revenue.

The thesis has four material risks, each with a defined diligence response

RISK	WHAT THE DATA SHOWS	MITIGANT
Single-month growth is noisy	A third of the dataset reports exactly 0.0% growth, and outliers reach +7,900%. Momentum readings on small bases are unreliable.	Underwrite on trailing 12-month and 3-month revenue, not the 30-day print. Require processor-level export before LOI.
Founder-dependent distribution	Where traffic comes from a personal audience rather than search, the asset does not survive the transfer.	Domain rating floor of 26 excludes audience-dependent assets. Verify traffic mix in diligence.
Data completeness	Only 573 of 1,000 companies carry a complete profile; 82% lack traffic data and 24% lack a country.	The screen uses only fields with high coverage. Missing data disqualifies rather than defers.
Concentration and small sample	Ten targets from one snapshot is a thin base, and the source sample is stratified rather than random.	Treat the funnel as a run-rate to be re-run monthly, not a fixed inventory. Size positions accordingly.

THE ASK

A disciplined buyer, a replenishing pipeline, and a screen that rejects 99% of it

Raising	[amount]	committed capital
Deployment	[n] acquisitions	over [period]
Cheque size	\$50k – \$500k	per asset, per the qualified cohort
Entry discipline	< 3× revenue	growing, DR ≥ 26, B2B

Every figure in this deck is computed from payment-processor-verified revenue, not self-reported metrics. The full dataset and screening code are available for review.
