

DATA ANALYSIS — TRUSTMRR SESSION 3

1,000 Verified Startups. Here Is What The Ledger Says.

A direct read of the TrustMRR dataset — what the numbers support, and what they don't.

\$13.5M

combined verified MRR

48%

of it held by the top 10 companies

10

companies out of 1,000, that's all

What TrustMRR Verifies — And What It Doesn't

Built to fix a trust problem

TrustMRR launched in October 2025 after founders were caught posting fabricated revenue screenshots on X. Instead of a claim, a founder connects a read-only Stripe or payment-provider API key. MRR is pulled straight from the processor. It updates on its own; a founder cannot type in a bigger number.

This dataset is a frozen snapshot of that database at 1,000 listed companies — the same size the live marketplace reached by its first quarter.

Where verification stops

- Only the connected payment metric is checked. Asking price, followers, domain rating and category are self-declared, not audited.
- The MRR figure itself has already been gamed once — founders created and voided fake invoices to inflate it, forcing a safeguard.
- Listing is opt-in. This is a sample of founders comfortable going public, not a random cross-section of startups.
- 13% of rows are anonymized ("Stealth Company") — one in eight companies here can't be cross-checked at all.

Revenue Concentrates in the Extreme

\$282

Median company MRR — this is the typical outcome

\$13,472

Mean company MRR — 48x the median

48% of all MRR sits with the top 10 companies — 1% of the dataset.

There is no average startup here. Stan alone, at \$3.57M MRR, out-earns roughly the bottom 850 companies combined. Any figure you quote as "typical" from this dataset has to be the median, not the mean — the mean is set by a handful of outliers.

Six of the Top Ten, by MRR (USD)

Recurring Revenue Is Not Stable Revenue

30-Day MRR Movement, All Companies

0%

Median 30-day MRR growth across all 1,000 companies

Verified doesn't mean durable.

TrustMRR proves what a company earned this month. It says nothing about next month. Almost a quarter of these companies are actively shrinking on the same number the platform just verified. Three fell to zero MRR in 30 days. Twenty-four more than doubled.

Read "MRR" as a snapshot, not a guarantee.

B2B Founders Earn More For the Same Effort

5.7x

The B2B median MRR over the B2C median

The population runs the wrong way

B2C outnumbers B2B 401 to 255 in this dataset. More founders are building for consumers, and the median consumer company earns \$181 a month against \$1,036 for B2B. Serving businesses is the harder sell and the better economics.

"Both" audiences land in between at \$352 — breadth alone does not buy B2B pricing.

Visibility Is Not Revenue

The platform's own premise, confirmed twice

TrustMRR exists because follower counts and screenshots stopped meaning anything. This dataset backs that up on its own terms: X followers explain almost none of the variation in MRR ($r = 0.02$). Active subscriptions explain most of it ($r = 0.91$).

Audience size is not a proxy for a business. Paying users are.

Read the Data With Its Filter On

1

This is a sample of transparency-seeking founders, not a census. Every average here describes people who opted into being watched — weight conclusions about "the indie startup economy" accordingly.

2

Verified MRR is a snapshot, not a forecast. Median 30-day growth is 0%, and a quarter of companies are shrinking on the exact number that was just verified.

3

Structure beats storytelling. B2B vs. B2C and paying subscribers vs. followers explain outcomes far better than category or geography does.
