

AN ACQUISITION FUND THESIS

Buying Cash-Flowing Software Businesses at a Discount

A data-backed investment thesis built on 1,000 verified, revenue-generating startups — and the 262 of them for sale right now.

Prepared by Kunal Tomar

Source: TrustMRR verified-revenue database

Real businesses. Real revenue. Priced like they don't matter.

Thousands of solo founders and small teams have built profitable, subscription-revenue software businesses — verified, Stripe-connected, cash-flowing. Most have no access to institutional capital and no natural buyer. When they need liquidity, they sell into a thin, inefficient market at a fraction of what the same recurring revenue would command anywhere else. That gap is the opportunity.

1,000

verified startups tracked, each with Stripe/RevenueCat-confirmed revenue

262

of them are actively for sale today
— real, priced deal flow

2.3x

median revenue multiple on live listings — well under typical SaaS M&A pricing

A large, tracked universe of profitable indie software

\$334M

cumulative all-time revenue across the dataset

\$134M

generated in the trailing 12 months

\$162M

implied ARR run-rate at current MRR

Where that revenue lives (trailing 12 months, per company)

Reading the tail

Median trailing-12-month revenue is just \$3,069 — most listings are tiny. But 233 companies already clear \$50k+ in trailing revenue, and 17 exceed \$1M. That long tail of small, real, growing businesses is exactly the raw material a roll-up strategy is built to consolidate.

262 priced, live acquisition targets — today

26% of every company in this dataset is actively listed for sale by its founder — not a hypothetical pipeline, a priced one.

What the current listings would cost to buy (by asking price)

\$86.8M

combined asking price across all 262 listings

\$20.5M

combined trailing-12-month revenue behind those listings

64%

of listings are priced under \$100k — accessible, bite-sized entry points

This deal flow prices below the broader SaaS M&A market

Why the gap exists

No natural buyer pool. Solo founders rarely have access to PE or strategic acquirers.

Small-check size. Most listings are too small for institutional M&A to bother with.

Urgency to exit. Burnout, new projects, and life events push founders to sell fast, not optimally.

Sources: this dataset (TrustMRR); Aventis Advisors, Flippa, and Acquire.com 2025–26 SaaS M&A multiple reports.

WHERE THE GROWTH IS

AI-native tools are already the largest single category

1 in 5 tracked startups is an AI product — nearly triple the next-largest category. This is where founder energy, new company formation, and (eventually) deal flow will keep concentrating.

Deal flow spans 65 countries — not one dependent market

Sourcing isn't the constraint

The US leads with 258 tracked companies, but the long tail runs deep — France, India, and the UK each contribute 50+, and meaningful volume shows up across 60+ additional countries. A fund built on this deal flow is not betting on one region staying hot; it can be selective across geography, currency, and category at once.

Six live listings that fit the thesis today

Real, named, currently-for-sale companies from this dataset — profitable, growing, and priced under 5x trailing revenue.

Company	Category	TTM Revenue	30d Growth	Asking Price	Multiple
Backlinker AI	Marketing	\$219,638	+577%	\$350,000	1.3x
SetSmart	SaaS	\$254,173	+29%	\$499,000	0.8x
BuildMyAgent.io	AI	\$541,806	+8%	\$289,000	1.1x
Conductor	Dev Tools	\$271,295	+8%	\$1,250,000	3.0x
PROSP	AI	\$507,250	+4%	\$1,000,000	0.8x
Videotok	AI	\$137,149	+20%	\$75,000	0.9x

Turning fragmented deal flow into compounding cash flow

01

Source

Screen the live TrustMRR deal flow — 262+ listings, refreshed continuously — for verified revenue, healthy margins, and clean payment data.

02

Acquire

Buy profitable, founder-operated software below prevailing SaaS M&A multiples, concentrated where deal flow is deepest: AI, SaaS, and productivity tools.

03

Operate

Install repeatable pricing, retention, and growth playbooks across the portfolio — the same few levers work across most of these small, under-managed products.

04

Compound

Reinvest cash flow into the next acquisition. Each addition lowers blended acquisition cost and builds a diversified, recurring-revenue portfolio.

The supply of sellable micro-SaaS is only getting bigger

1 More founders, faster launches

AI tooling has cut the time and cost to launch a monetizing SaaS product to weeks, not years — 197 of the 1,000 tracked companies are AI products, the single largest category.

2 A generation of builders is ready to sell

26% of every company in this dataset is already listed for sale — evidence that supply is active today, not theoretical.

3 Verified data removes the guesswork

Every company in this pipeline has Stripe-, RevenueCat-, or Paddle-confirmed revenue — diligence starts from real numbers, not founder claims.

4 Pricing hasn't caught up to demand

Median deals still clear at 2.3x trailing revenue — roughly half of typical private SaaS M&A pricing — because most buyers still aren't looking at this end of the market.

NEXT STEPS

Let's build the acquisition vehicle

The deal flow is real, priced, and refreshing continuously. What's needed now is capital to move first on the strongest listings and the operating playbook to compound them into a portfolio.

Capital

To acquire an initial portfolio from the current 262-listing pipeline

Partners

Operating and diligence support to move quickly on verified deals

Timeline

Deploy against live listings first — this pipeline moves in weeks, not quarters

Kunal Tomar

Thank you — happy to walk through the full dataset and model.
