

EdTech Isn't Dead. The Old EdTech Is.

A revenue-verified case for reopening the EdTech thesis.

The Consensus View

What the market believes

Post-2022, most funds have written off EdTech — low growth, low margins, saturated. Capital has rotated to AI.

What this deck challenges

This argument is built on revenue data — not opinion, funding announcements, or self-reported metrics. The conclusion is different.

The Data Behind This

1,000

Startups

Bootstrapped, revenue-verified companies in the dataset

24

Categories

Spanning AI, SaaS, Education, Mobile, and more

\$133.7M

Combined TTM Revenue

Trailing-12-month revenue across all companies

30

Education Companies

Operating businesses in the Education category

Where the Capital Went

Capital crowded out Education

AI has 197 companies — 6.6× more than Education's 30. Founder attention and capital have concentrated heavily in AI. Education operates with a fraction of the competition.

The Overlooked Number

Education leads on revenue quality

Education has the **highest median MRR of any major category** — \$2,142, nearly 5× AI's \$446 — despite having 85% fewer companies competing for capital. This is not a marginal difference. It is a structural one.

Not a Fluke

Robustness check applied

Each category's single largest company was removed to test whether one outlier was inflating the median. Education's median MRR dropped from **\$2,142** to **\$2,084** — still the highest of any category.

This is a broad-based pattern across 30 companies, not a single company skewing the average.

Proof Points

Four revenue-verified Education companies from the dataset:

Kibu

\$1.85M · 12-month revenue — DSP and care-team support software for special education service providers.

DataExpert / TechCreator

\$1.47M · 12-month revenue — Technical upskilling programs for data and technology professionals.

Codédex

\$843K · 12-month revenue — Beginner-friendly coding education with structured, project-based learning paths.

MagicSlides.app

\$215K · 12-month revenue — AI-powered presentation tool used in education and corporate training contexts.

Why This Happened

The narrative moved faster than the fundamentals

The 2021–2022 EdTech boom-bust — Byju's collapse, Chegg decline, MasterClass slowdown — created a category-wide write-off narrative. Capital rotated to AI.

But the revenue data shows the operating businesses — the ones actually charging customers — were never the problem. The narrative priced in a correction that didn't apply to the underlying fundamentals.

The Thesis

Three reasons to reopen an EdTech fund:

1

Higher revenue quality per company

Education's median MRR (\$2,142) is 4.8× AI and 7.1× SaaS. Revenue quality is objectively higher.

2

Lower founder and capital competition

30 Education companies vs. 197 in AI. Less competition means better entry terms and less noise.

3

A mispricing story, not a growth story

Growth is flat across all categories. This is a scarcity and mispricing setup — exactly what a contrarian fund should target.

The Ask

Propose a scoping session to build a shortlist of Education-category acquisition or investment targets from this revenue-verified dataset.

What we bring

Access to 30 revenue-verified Education companies with Stripe/RevenueCat/API-confirmed trailing-12-month revenue data.

What we're looking for

A defined conversation to align on fund thesis, target profile, and next steps — grounded in operating revenue, not projections.
