

Where the real money hides

A plain-English read of 1,000 digital businesses —
without the spreadsheet noise.

2%

of companies generate almost
60% of revenue

The story is not “what is the average company?”
The story is “which pockets are actually investable?”

The headline number is misleading

A few giants pull the average up; most businesses are far smaller.

WHAT A TYPICAL COMPANY LOOKS LIKE

\$15.6K

average monthly revenue

\$400

median monthly revenue

The average makes the market look healthier than it feels for a normal company.

Read the market through tiers, not averages.

Revenue ladder — most companies sit in the lower tiers

58%

under \$1K/month

80%

under \$10K/month

For a client, the first move is segmentation: separate “survivors”, “steady earners”, and “scale outliers”.

The market is won by a tiny top layer

The economic value is concentrated in a small set of breakout businesses.

20 companies

generate almost

60%

of all current revenue

This is not a balanced marketplace. It behaves like a creator economy: many participants, few big winners.

Share of total revenue captured by top companies

Implication: the opportunity is not in “average performance” — it is in identifying the traits of the winners early.

Think of this as a hunting map: the value is in finding breakout pockets, not summarizing the whole crowd.

B2B looks like the stronger monetization lane

Consumer products are more numerous, but business-facing products earn more per company.

THE MONETIZATION CONTRAST

\$1,240

median monthly revenue for B2B

\$304

median monthly revenue for B2C

B2B median revenue is roughly 4× B2C.

Even though B2C has more companies, B2B contributes nearly 70% of revenue among businesses with known audience type.

Revenue share by audience type

Client lens: prioritize business buyers when the goal is dependable revenue, not just audience reach.

The revenue signal points toward B2B: fewer companies, larger median, stronger share of dollars.

AI is crowded — not automatically richer

The hottest label is not necessarily the best-monetized segment.

AI has the most companies, but Education and Marketing show much stronger median revenue.

A client should separate “popular category” from “commercially proven category”.

Company count by category

Median monthly revenue — selected categories

AI median: \$503

Education median: \$2,435 • Marketing median: \$2,370

The smarter question is not “is it AI?” but “does this segment have repeated buyer willingness?”

Growth looks exciting only when it has scale behind it

A huge percentage jump from a tiny base can look louder than it really is.

Current growth profile

The center of gravity is flat: the median growth rate is 0%.

Compare growth with dollars added

Stealth breakout

\$858K

monthly revenue

+719%

growth

Small-base spike

\$2.2K

monthly revenue

+7,900%

growth

Client lens: chase growth that creates material dollar movement, not just a striking percentage.

The best opportunities combine three things: revenue base, momentum, and segment quality.

So what should the client do with this?

Use the market as a signal engine — not a ranking table.

1 Ignore the average

Start by separating tiny, steady, and breakout businesses. The “average” hides the market shape.

2 Prioritize monetized pockets

B2B, Marketing, and Education show stronger commercial signals than hype-heavy labels alone.

3 Validate before action

Use revenue base + growth + buyer type. Treat social following and incomplete visitor data as supporting context only.

Bottom line: the client should not ask “what is the average startup doing?” — they should ask “which segments repeatedly convert attention into revenue?”
