

From a thousand to four.

Four cuts, each one a question a real investment committee would ask — and the four names left standing at the end of them.

THE FOUR CUTS

- 01** Can it pay?
1,000 → 85
- 02** Is it worth owning?
85 → 12
- 03** Do the numbers agree?
12 → 5
- 04** Can it be diligenced?
5 → 4

Can it actually get paid?

Four revenue gates, all using fields that are 100% populated

1,000

Every company on the list

The starting universe

409

MRR of at least \$1,000

Is anyone paying, repeatedly?

164

MRR growing month on month

Is it going up rather than down?

125

50 or more active subscriptions

Spread demand, or one whale?

85

Trailing revenue above \$50,000

Has it survived a full year?

Why these four fields: MRR, subscriptions and trailing revenue are complete for all 1,000 rows. Nothing is excluded for staying quiet — the sparse fields explain the survivors, they never select them.

Is it worth owning?

Seven parameters scored 0–2, because clearing a revenue bar is not the same as being investable

Parameter	Measured by	1 pt / 2 pts
Scale	ARR	\$250k / \$1M
Momentum	30-day MRR growth	5% / 15%
Durability	Run-rate ÷ trailing	1.0x / 1.5x
Revenue quality	MRR ÷ monthly revenue	0.6 / 0.85
Monetisation	ARPU	\$20 / \$75
Concentration	Active subscriptions	200 / 1,000
Moat	Domain authority	25 / 50

Being listed for sale is held outside the score — it is a discount on price, not a mark against the business.

Tier	n	Median ARR	Growth	ARPU	For sale
Tier 1	12	\$1.52M	24.3%	\$82	0
Tier 2	37	\$323k	12.1%	\$55	6
Tier 3	36	\$185k	5.0%	\$38	15

The tiers validate themselves

Nobody in Tier 1 is for sale. Six of 37 in Tier 2 are. Fifteen of 36 in Tier 3 are. Founders are pricing their own businesses in exactly the order the scorecard ranks them — an independent check that the seven parameters are measuring something real.

Tier 1 holds 66% of the ARR inside the 85 while being 14% of its companies.

Do the company's own numbers agree?

The score rewards size and speed. It cannot tell you whether the story matches the bank account

Two checks: reported MRR should not exceed the cash collected last month, and MRR growth should point the same way as revenue growth. Seven of the twelve fail one or both.

Company	MRR ÷ cash	MRR growth	Revenue growth	Verdict
Postiz	1.02	+15.0%	+22.7%	Clean — cash growing faster than MRR
Cometly	0.94	+3.0%	+17.0%	Clean — cash accelerating
Apiframe	0.79	+31.0%	+31.9%	Clean — near-perfect agreement
RankAI	1.03	+23.4%	+35.4%	Clean
Stealth Company	0.97	+32.6%	+34.7%	Clean
GojiberryAI	1.28	+23.6%	+19.7%	Both growing, but MRR runs ahead of cash
Supergrow	2.47	+24.9%	+14.0%	MRR is 2.5x the cash collected
Kibu	1.17	+52.8%	−25.6%	MRR up 53% while revenue fell 26%
Stan	1.25	+0.4%	−7.6%	Barely growing; revenue already falling

Upscale System, Web3Forms and AdStellar fail the same way and are not shown. Supergrow scores 12, with only two companies scoring higher, and is the first name this cut removes.

MRR ÷ cash = mrr_usd ÷ revenue_30d_usd. Revenue growth as reported in revenue_growth_30d_pct.

Can it actually be diligenced?

Two removals and one conditional readmission

REMOVE

Stealth Company

\$2.01M ARR growing 32.6% across 6,673 customers — the numbers are clean and the growth is the best of the five. But there is no name, no domain, no country and no sector. Nothing can be verified, no reference called, no market sized.

There is no way to underwrite a company you cannot identify.

REMOVE

RankAI

\$685k ARR growing 23.4% at a \$350 ARPU, and it passes every integrity check. But 163 customers, domain authority 34 and 79 followers means the distribution is unproven — every new customer is bought, none arrives.

Closest call on the page. A watch-list name, not a decline.

READMIT

GojiberryAI

The only asset combining real scale with real speed: \$5.94M ARR growing 23.6% across 4,642 customers. It failed cut 03 on one measure — MRR 1.28x collected cash — while both growth signals still point up.

MRR ahead of cash is a billing-timing question, not a falsified number. Admitted subject to reconciliation.

Postiz, Cometly and Apiframe survive all four cuts untouched. GojiberryAI returns as the fourth, conditionally.

The decision

Four names.

1

Postiz

HK · Social Media · B2B

\$2.13M ARR · +15.0% · 5,237 subs · DR 70

40%

2

GojiberryAI

US · AI · B2B

\$5.94M ARR · +23.6% · 4,642 subs · DR 47

30%

3

Cometly

US · Analytics · B2B

\$2.49M ARR · +3.0% · 307 subs · DR 69

20%

4

Apiframe

SG · AI · B2B

\$297k ARR · +31.0% · 425 subs · DR 70

10%

All four are B2B. None is listed for sale. None was selected on a field the dataset leaves blank.

The case, and the risk, for each

What I am buying and what would break it

Postiz

ANCHOR · 40%

Open-source social scheduling for developers and agencies. 5,237 subscribers at \$34 — demand is spread, not concentrated. Domain authority 70 means traffic it owns rather than rents. Run-rate 2.85x trailing revenue.

Risk: \$34 ARPU leaves little room to absorb churn, and an open-source core invites a free alternative.

GojiberryAI

GROWTH · 30%

The only name pairing scale with speed: \$5.94M ARR growing 23.6% across 4,642 customers at \$107 ARPU. Run-rate 3.01x trailing. Sales tooling at a \$99 entry price with an enterprise tier above it.

Risk: MRR is 1.28x collected cash and all lifetime revenue arrived within 12 months. Reconcile billing before funding.

Cometly

BALLAST · 20%

\$676 ARPU, domain authority 69 and \$9.4M of lifetime revenue — the only company here proven across more than one cycle. MRR is flat at 3%, but cash revenue grew 17%.

Risk: flat MRR. This is a durability position, not a compounder. Do not price it as growth.

Apiframe

OPTION · 10%

Cleanest numbers in the dataset: MRR +31.0% against revenue +31.9%. Developer API with domain authority 70 and 425 customers at \$58. Small enough that entry is cheap and a full loss is survivable.

Risk: at \$297k ARR it is one enterprise customer away from a different business. Size accordingly.

Before the money moves

Four questions this dataset cannot answer.

1 Monthly churn

Every growth figure here is a single 30-day reading. A good month and a compounding business are not the same claim. Ask for twelve months of cohort retention.

2 Cost to acquire

82% of the dataset never disclosed traffic, all four picks included. Without CAC there is no payback period and no defensible entry price.

3 Revenue concentration

Cometly at 307 customers and Apiframe at 425 could each carry a client worth a fifth of revenue. Ask for the top-ten customer table.

4 Billing reconciliation

GojiberryAI's MRR runs 28% ahead of collected cash. Either annual contracts booked early, or a refund problem. Resolve before funding.

Four of a thousand. If only one question can be asked, ask for churn.
