

AI Presentation Assignment

The Trust MRR Landscape

A data-driven read on scale, concentration, typical-company performance, and monetization potential across 1,000 tracked startups, cross-checked against the class Q&A analysis

Datasets: TrustMRR 1,000-row snapshot (frozen 30 Jul 2026)

Prepared for: Senior Management & Key Stakeholders

By:
Soham Dhamnaskar
Section F

A concentrated \$13.5M MRR base, where “total” and “typical” tell different stories

01

Scale is real, ownership is narrow.

1,000 tracked startups generate \$13.47M in combined MRR, but 16 startups (1.6%) hold 55% of it and a single listing (“Stan”) alone is 26.5%.

02

Total ≠ typical: AI wins on volume, not on the typical company.

AI is #1 of 29 categories by total MRR (\$1.81M) but ranks 13th by median company MRR (just \$446). Customer Support, Marketplace, Education, Marketing and Analytics show the strongest typical per-company performance.

03

Anonymous listings are a measurable, non-trivial slice.

130 listings with a blank name, “Stealth Company,” or “Hidden Business” — carry 28.1% of MRR (\$3.79M) and \$4.19M of last-30-day revenue (26.9% of the \$15.6M total).

04

Subscription count predicts revenue; follower count doesn't.

Active subscriptions correlates strongly with 30-day revenue ($r = 0.802$, all 1,000 rows). X followers barely correlate with 3-month revenue ($r = 0.025$, 984 complete pairs), vanity metrics aren't a revenue signal here.

05

A concrete, evidence-backed action list exists.

Data-quality fixes, a named risk (a top-2 listing down 74% in 30 days), and a defined Now/Next/Explore agenda are ready for sign-off.

TRUST MRR AT A GLANCE

\$13.47M in tracked MRR across 1,000 startups, the typical listing earns far less than the average

\$13.47M

Total combined MRR
across all 1,000 tracked startups

803 / 1,000

Startups reporting MRR > \$0
(197 report \$0 recurring MRR)

\$282

Median MRR, incl. zeroes (class convention)
among active-only startups, median is
\$1,036

87.2%

Of total MRR runs on Stripe
as the payment processor

Where the money actually sits: MRR by startup size band

16 startups
(1.6% of the platform)
generate 55% of all MRR

Median MRR including zeroes (\$282) sits well below the active-only median (\$1,036) because 197 listings report no recurring revenue at all. Both figures use the class-established convention (zeroes included, blanks excluded).

WHERE MRR COMES FROM

The US, a handful of named categories, and B2B relationships carry disproportionate weight

MRR by named category (top 8 of 29)

56.5% of total MRR (\$7.6M) sits in startups with no category tag — not shown above.

MRR by country (top 6 of 60+)

Cross-check on 30-day revenue: US leads all countries (\$9.84M); AI leads all categories (\$2.36M) — consistent with the MRR picture above.

B2B startups monetize ~2.6x deeper per listing than B2C

\$13,150

\$5,102

avg MRR per B2B startup

avg MRR per B2C startup

255 B2B startups average \$13,150 in MRR each (\$3.35M total); 401 B2C startups average \$5,102 each (\$2.05M total) — despite outnumbering B2B listings.

WHAT IS ACTUALLY PERFORMING WELL?

AI wins on total MRR, but the typical AI company is not the strongest performer

Top 5 categories by TOTAL MRR

Top 5 categories by MEDIAN company MRR

Education and Marketing appear on both lists , genuinely strong at both scale and typical-company level. Customer Support (n=5) and Marketplace (n=7) lead on median but from small samples — directional, not a scaled trend.

AI: rank #1 total, #13 of 29 median

197 companies drive a \$1.81M total, but the typical AI company earns just \$446/month — a handful of large names pull the average far above the median.

E-comm: highest AVERAGE MRR, low median

\$20,829 mean MRR (highest of any category) but median only \$155, ranking #22 of 29 — a few big winners (e.g. Eloking) skew the mean.

WHAT IS CHANGING

Of MRR that matters at scale, most is flat, growth is real but concentrated in a minority

30-day MRR trajectory, among startups with \$3,000+ MRR (295 startups, \$13.2M)

Named movers worth watching		
GojiberryAI	AI · US	\$494.7K MRR, +23.6%
Kibu	Education · US	\$234.3K MRR, +52.8%
Postiz	Social Media · HK	\$177.1K MRR, +15.0%
“Stealth Company”	Anonymous · US	\$747.1K MRR, -74.3%
PolyPick	Fintech · —	\$20.7K MRR, -66.6%
Sight AI	AI · —	\$10.3K MRR, -54.6%

WHAT IS DRIVING / DISTORTING THE PICTURE

One listing and a class of anonymous names both distort the aggregate picture

Cumulative share of total MRR held by the N largest startups

Including "Stan": Top 10 = 48.0% of \$13.47M. Excluding "Stan": Top 10 = 31.0% of the \$9.90M remaining.

Why it matters: any platform-level metric is exposed both to a handful of dominant names and to a meaningfully sized anonymous cohort that cannot be attributed, explained, or drilled into.

FACT

130 listings are anonymous

Per the class-established definition — blank startup_name, "Stealth Company", or "Hidden Business" (129 + 1 respectively):

Named: \$11.40M revenue'30d (870 listings)

Anonymous: \$4.19M revenue'30d (130 listings)

In MRR terms: anonymous listings hold 28.1% of total MRR (\$3.79M) including the #2 largest listing overall.

WHERE IS THE OPPORTUNITY

AI wins on volume, not consistency. Education pairs scale with a cleaner signal

197

AI startups tracked
(largest named category by count)

\$446

Median AI company MRR
(rank #13 of 29 — volume ≠ typical strength)

+239.5%

Fastest-growing AI name at scale:
LLM Gateway, \$47.2K MRR

−54.6%

Steepest AI decliner at scale:
Sight AI, \$10.3K MRR

Reading the opportunity

AI is not a uniform tailwind. The category carries the platform's biggest named winners (GojiberryAI at \$494.7K MRR, +23.6%; Rezi at \$259.7K MRR) alongside sharp decliners (Sight AI −54.6%, Adle −36.3%, Comp AI −22.3%) — and a typical company earning just \$446/month. *INTERPRETATION: opportunity in AI depends on picking the right names, not riding a category-wide wave.*

Second-tier opportunity: Education. 30 startups, \$523.7K MRR (3.9% of total) AND a \$2,142 median company MRR (top 3 of 29 by typical performance), with a standout grower (Kibu, \$234.3K MRR, +52.8%) — scale and typical-company strength together, unlike AI.

Growth leaders at scale (\$1K+ MRR)

GojiberryAI AI	\$494.7K, +23.6%
Kibu Education	\$234.3K, +52.8%
Postiz Social Media	\$177.1K, +15.0%
Supergrow Social Media	\$79.5K, +24.9%
LLM Gateway AI	\$47.2K, +239.5%

Two distinct pockets of untapped monetization, one near-term, one requiring validation

NEAR-TERM

Convert one-time revenue to recurring

FACT: 108 startups report \$0 MRR but real revenue, combined \$2.48M+ in all-time revenue with nothing captured as recurring (e.g. Eloking, \$1.33M all-time revenue; an anonymous listing at \$456.7K).

HYPOTHESIS: some of this is a genuine subscription-conversion opportunity; some may be intentional one-time/e-commerce business models. The dataset cannot distinguish these — validation needed before sizing any upside.

LONGER-TERM

Monetize the marketplace itself

FACT: 262 startups (26.2%) are listed for sale, carrying a combined asking price of \$86.8M against only \$2.05M of their own MRR (15.2% of platform total). The median revenue multiple across these listings is 2.30x.

INTERPRETATION: this is a sizeable transaction pool that is not visibly monetized by the platform today — e.g. via a success fee or take-rate on completed sales, benchmarked off the 2.30x median multiple.

Subscription count predicts revenue, follower count doesn't

Relationships worth acting on

$r = 0.802$ Active subscriptions vs. 30-day revenue (all 1,000 rows), a strong, intuitive signal. Subscription count is a legitimate internal health metric.

$r = 0.025$ X followers vs. 3-month revenue (984 complete pairs, full dataset), essentially no relationship. Don't build features that assume social following predicts revenue.

Field coverage gaps

domain_rating: 286 of 1,000 rows blank (28.6%)

category: 72.6% populated — gates 56.5% of MRR out of any segmented view

country: 75.9% populated — 21.8% of MRR unattributed

visitors / revenue-per-visitor: populated for under 18% of listings — not enough for any funnel claim

What this means for the roadmap

■ Treat subscription count as the health metric

Build dashboards, alerts, and benchmarks around active_subscriptions — it's the field with real predictive weight, unlike social metrics.

■ Don't chase follower-based features

Any roadmap item premised on "social reach drives revenue" isn't supported by this data ($r=0.025$) — deprioritize until better evidence appears.

■ Backfill category, country & domain_rating

These three fields gate the majority of segmented analysis — mandate capture at listing creation/edit.

■ No effort/cost/timeline data exists

The dataset contains no engineering-effort, cost, or timeline fields — prioritization reflects evidence strength only, not build cost.

What to watch, and where the less obvious potential sits

RISKS

! Single-name & anonymous concentration

“Stan” alone is 26.5% of MRR; 130 anonymous listings hold another 28.1% — over half of total MRR sits in names that are either singular or unattributable.

! Opacity in the #2 listing

The second-largest listing (\$747.1K MRR, anonymous) fell 74.3% in 30 days with no way to investigate why.

! Growth is narrow, not systemic

Within the \$3K+ MRR cohort, 59% of that MRR is flat and 16% is declining — only 23% is actively growing.

WHITESPACE

+ Typical-performer categories are under-discussed

Customer Support (\$5,163 median) and Marketplace (\$4,322 median) outperform AI and E-comm per company — worth deliberate investigation despite small samples (n=5, n=7).

+ High volume, shallow monetization (India)

59 listed startups (6th-highest by count) but only \$156.6K combined MRR (1.2% of total) — stage, pricing, or purchasing-power differences not yet confirmed.

+ Revenue-but-no-MRR cohort

108 startups with \$2.48M+ in real revenue and \$0 recurring MRR remain the clearest concrete pocket of potential, pending business-model validation.

No cost/effort data exists in the source — the priorities on the next slide reflect evidence strength, not build cost.

What management should do next

NOW

- Fix category/country/domain_rating tags on the highest-MRR anonymous listings
- Investigate the anonymous listing down 74.3% in 30 days
- Add concentration monitoring (single-name + anonymous cohort) so metrics aren't silently distorted

NEXT

- Validate why Customer Support & Marketplace lead on median, test whether the pattern holds beyond $n=5/n=7$
- Validate the recurring-conversion hypothesis on the 108-startup cohort
- Study what separates AI growers from decliners before broad category investment

EXPLORE / LATER

- Investigate India's high-volume, low-MRR pattern before any go-to-market shift
- Design a marketplace take-rate model against the \$86.8M pool (2.30x median multiple as benchmark)
- Re-run follower/engagement correlation checks periodically — $r=0.025$ today, but worth re-testing as the platform grows

Management: sponsor data-completeness work; commission a review of the down-74% listing. **Product/Business:** validate typical-performer categories & recurring-conversion cohort. **Developers:** mandate category/country/domain_rating capture; build on subscription count, not follower count.
