

Startup Revenue Data Analysis

Executive Summary — Frozen 30 Jul 2026 Dataset · 8,782 Startups, 117 Countries

8,782

Startups tracked across 117 countries

\$227M

12-month revenue processed via Stripe alone (89% of gateway revenue)

\$91

Median 12-month revenue — the mean (\$28K) is skewed by a handful of large players

$r = 0.12$

Log-log correlation between X followers and MRR — a weak, mostly negligible link

The story in brief: Stripe dominates the payment layer (60% of listings, 89% of tracked revenue). Revenue is extremely concentrated — a small number of breakout products (Stan, Gojiberry, Rezi) carry the top line while the typical startup earns under \$100/year. Social proof doesn't predict monetization, tiered subscriptions are the default pricing motion, and e-commerce tools generate the highest average MRR of any category. Roughly 40% of context fields (category, pricing, audience) are missing, so this dataset is best used as a sourcing funnel — not a precise valuation tool.

Dataset Overview: Where the Startups Are

Interpretation: The US leads with 1,657 startups (19%), nearly double India in second place. The top 5 countries account for just under half of all listings. Context fields (category, pricing, audience) are missing on over a third of rows — read every category- or pricing-based stat in this report as a sample, not the full population.

DATA COMPLETENESS

Core financials

100% populated

Category / pricing / audience

37–45% missing

Visitor traffic

83% missing

Revenue per visitor

91% missing

Asking price / multiple

78% missing (non-listed startups)

Payment Gateway Landscape

Most Used Payment Gateway (share of startups)

Total 12-Month Revenue by Payment Gateway

Interpretation: Stripe is the default choice for 60% of startups and carries 89% of all tracked 12-month revenue (\$227M of \$255M) — the gateway of choice for revenue-generating SaaS/API businesses. RevenueCat is a distant second, concentrated among mobile-subscription apps. Niche gateways (Superwall, Whop, Polar) show healthy revenue-per-user despite low volume.

Revenue Distribution: Mean vs. Median

Interpretation: Mean and median diverge enormously (12-month mean \$28,124 vs. median \$91) — a classic power-law distribution where a small number of breakout startups pull the average far above what a typical listing earns. Use the median to describe a "typical" startup on this marketplace; use the mean only when sizing total addressable revenue.

Top 10 Startups by MRR

Interpretation: Stan's \$3.57M MRR is an order of magnitude above the next closest competitor — it alone represents roughly 40% of total MRR across the entire top 10. Category is uneven at the top: AI tools (Gojiberry, Rezi) and vertical SaaS (Kibu, Cometly, 1Lookup) both break through, so there's no single winning category, but each leader owns a defensible niche.

Fastest-Growing MRR (30-Day)

Interpretation: Filtered to startups with MRR above \$1,000 to remove noise from near-zero bases. Growth rates above 1,000% in a single month are extreme even by startup standards and most likely reflect a low starting base, a pricing change, or a data artifact rather than organic demand — verify directly with the seller before using these figures to justify a premium.

Category Economics: Average MRR

Interpretation: E-commerce tools post the highest average MRR (\$4,168), ahead of Social Media and Analytics — likely because e-comm tools bill against a merchant's revenue and scale with GMV. AI, despite having the most listings overall (1,430), ranks 8th on average MRR: the category is crowded with many small/early products dragging the average down.

Most Common Pricing Models

Interpretation: Pricing text was freeform, so models were grouped into buckets by keyword. Tiered subscriptions (e.g. Starter/Pro/Scale) dominate at 2,769 listings — more than 3x the next bucket — confirming SaaS-style tiering is the default go-to-market motion. 43% of all listings left pricing_model blank entirely.

Does Audience Size Predict Revenue?

Interpretation: Neither audience size nor site traffic reliably predicts revenue. X followers vs. MRR is essentially flat (log-log $r = 0.12$, explaining under 2% of variance). And 80 startups combine top-quartile traffic with bottom-quartile revenue-per-visitor — real audiences that are heavily under-monetized, a easier fix than acquiring new traffic from zero.

Key Takeaways & Data Limitations

KEY TAKEAWAYS

Stripe is the infrastructure backbone: 60% of startups, 89% of tracked revenue.

Revenue is a power law — median \$91/yr vs. mean \$28K/yr on a 12-month basis.

Tiered subscriptions are the default pricing model (55% of listings with pricing data).

E-commerce leads category economics; AI leads volume but trails on average MRR.

Social following and traffic size are weak-to-no predictors of revenue.

LIMITATIONS TO KEEP IN MIND

Self-reported, unaudited data — sellers have an incentive to round figures up.

37–45% of context fields (category, pricing, audience) are blank.

No cost, margin, or churn data — revenue alone can't show profitability.

Single time snapshot (30 Jul 2026) — no trend history beyond 30-day growth.

Revenue is flat USD with no currency or purchasing-power adjustment.
