

MICRO-SAAS ACQUISITION MARKET

TrustMRR Marketplace Intelligence Brief

A data-driven read on 1,000 listed businesses — sizing the opportunity, screening the multiples, and flagging what the numbers can't yet tell us.

Prepared for: Executive Leadership Review

Source: TrustMRR listings dataset, frozen 30 Jul 2026 | n = 1,000 businesses

1,000

Businesses tracked

262

Actively listed for sale

2.30x

Median asking multiple

30

Categories represented

Three things to know before we go further

01

Supply is real but thin

1,000 listed businesses, but the median business does just \$282 MRR. This is a long-tail, founder-led market — not a pipeline of scaled SaaS targets.

02

Value is extremely concentrated

The top 1.6% of businesses (16 of 1,000) generate 55% of all platform MRR. Category- and market-wide averages are meaningless without segmenting by scale.

03

Don't trust the multiple as printed

The listed "revenue multiple" field barely correlates with asking price $\div$ revenue ($r = 0.06$). Every valuation conclusion in this deck is rebuilt from raw financials, not the seller-stated field.

Bottom line: this dataset supports fast, disciplined screening of micro-SaaS acquisition targets — but only if we filter for outliers, segment by scale, and independently verify pricing before any offer.

Where the supply is concentrated

By category (n = 726 labeled)

*Includes 22 smaller labeled categories + 274 unlabeled records

By country (n = 759 labeled)

*Spans 30+ countries; 241 records unlabeled

A handful of businesses carry the market

Businesses by monthly revenue tier

MRR tier, count of businesses (n = 1,000)

55%

of all platform MRR is generated by just 16 businesses — 1.6% of the base — each earning \$100K+/month.

94.7%

of platform MRR sits in the top two tiers (212 businesses, 21%). The remaining 79% of listings share just 5.3% of the revenue.

Implication: screening or pricing decisions built on the market "average" will systematically misread 98% of the listings. Segment by scale tier, always.

What's actually for sale, and at what price

262

Businesses listed for sale

26.2% of the full base

\$35,000

Median asking price

Mean is \$332,488 — skewed by a few large listings

2.30x

Median stated revenue multiple

As printed by sellers/platform

16

Categories with ≥5 priced listings

Enough sample to benchmark

Data caveat

The stated revenue multiple correlates poorly with asking price ÷ annualized revenue ($r = 0.06$). It appears to be computed off an inconsistent or seller-chosen revenue base. We treat it as directional only — every multiple used for decision-making in this brief is rebuilt from raw MRR and revenue fields.

Median asking multiple by category (outlier-capped)

Categories with fewer than 5 priced listings excluded (insufficient sample). Multiples capped at 20x to remove single-record distortions before computing medians.

Data integrity notes for the record

Field completeness	Category (27%), country (24%), and domain rating (29%) are missing on a meaningful share of records — segment-level conclusions with small n should be treated as directional.
Multiple field reliability	Seller-stated "revenue multiple" does not reconcile with asking price ÷ revenue. All multiples in this brief are recomputed from raw MRR/ARR, not read from that column.
Growth outliers	30-day growth fields include readings up to 7,900%, driven by near-zero prior-period bases. These are excluded from any trend statistic shown here.
Snapshot, not time series	This is a single frozen pull (30 Jul 2026). Category and pricing patterns should be re-validated against a rolling refresh before they inform recurring decisions.

Strategic implications for sourcing & screening

1

Prioritize AI and Mobile Apps for deal flow

Largest listed supply (197 and 52 respectively) combined with above-median multiples (2.65x, 2.30x) — best balance of volume and pricing signal.

High impact / Low effort

2

Screen on medians and scale tiers, never on category averages

A single \$3.5M MRR outlier can swing a category mean by 10–20x. Build screening thresholds off median MRR and the revenue-tier buckets shown here.

High impact / Low effort

3

Rebuild every quoted multiple before an LOI

Independently calculate asking price ÷ trailing revenue for any target before benchmarking or negotiating — do not cite the platform's printed multiple.

High impact / Medium effort

4

Treat Dev Tools and SaaS as value opportunities, not weak categories

Lowest median multiples (1.35x, 1.10x) likely reflect higher perceived churn/build-vs-buy risk — worth a closer look for contrarian value, not automatic pass.

Medium impact / Medium effort

NEXT STEPS

What we'd do with another two weeks

01

Rebuild the multiple

Recompute a clean valuation multiple from raw MRR/ARR for all 262 on-sale listings; publish as the benchmark of record.

02

Validate AI category quality

Sample-audit "AI" listings' value propositions to separate genuinely differentiated products from category-chasing labels.

03

Stand up a live refresh

Move from a frozen snapshot to a monthly pull so scale, pricing, and multiple trends can be tracked, not just measured once.

04

Define screening thresholds

Translate the scale-tier and category findings into a formal target filter for sourcing — minimum MRR, category focus, multiple ceiling.
