

THE TRUSTMRR DATASET

The Power Law Hiding in 1,000 Startups

What verified revenue data from 1,000 startup listings reveals about revenue concentration, category hype, and what actually predicts value.

1,000 STARTUPS · \$13.5M COMBINED MRR · FROZEN 30 JUL 2026

Revenue Is a Power Law, Not a Curve

Where the dataset's \$13.5M in combined MRR actually sits

48%

of ALL revenue comes from just the top 10 companies — 1% of listings

71%

comes from the top 50 — just 5% of all listings in the dataset

A handful of winners carry the whole market — any “average startup” claim needs the median, not the mean.

Based on all 1,000 listings, ranked by MRR, share of \$13.5M combined total

Hype ≠ Value

Median monthly recurring revenue by category (categories with 10+ listings)

n = 30–66 listings per category shown; 30–42–19–36–13–197–66 respectively

20%

**of ALL 1,000 listings are AI startups (197)
— the single largest category by far**

Yet its median MRR (\$446) ranks near the bottom of every major category — well below Marketing, Analytics, and Education. Its mean (\$9,167) is 20x its median, the widest gap of any major category — a few breakout AI tools distort the average.

What Actually Predicts Value

Three signals that separate real revenue from vanity metrics

4.5x

B2B commands a real premium

B2B startups post 4.5x higher median MRR than B2C (\$1,639 vs \$366, among companies with active subscribers) — and 4.4x more revenue per subscriber (\$47 vs \$11). “Both” audiences land in between at \$693 median MRR.

0.51

SEO authority beats social buzz

Domain rating correlates 0.51 with asking price and 0.48 with MRR. X follower count correlates just 0.18 with revenue — a near-vanity metric for gauging a business's real worth.

5x

“Free” isn’t a growth engine here

Startups without a stated free tier show ~5x higher median MRR (\$751) than those advertising one (\$159) — freemium often signals early-stage, pre-monetization products in this dataset.

Where You're Based Still Predicts Revenue

Median MRR by country (top 8 countries by listing count)

Countries with 9+ listings; 241 of 1,000 rows have no country recorded

Reading the data responsibly

241 rows have no country on file — geographic gaps aren't "zero-revenue" countries, they're unknowns.

129 rows are anonymized "Stealth Company" listings — 13% of the dataset can't be analyzed by name.

197 rows report exactly \$0 MRR — nearly 1 in 5 listings are pre-revenue or dormant.

A Market With Its Own Physics

Inside the 262 listings actually for sale

55.8%

of Mobile Apps listings are for sale — the highest flip rate of any category

0x–694x

range of implied revenue multiples on asking price — still a very inefficient market

\$1,055

median MRR of for-sale companies, vs just \$187 for those not listed — sellers are the winners, not the strugglers

Median asking price across all for-sale listings: \$35,000 · Median implied multiple: 3.2x annualized MRR

1,000 listings, one clear pattern: revenue, hype, and price don't move together.
