

TrustMRR Dataset — Market Scan & Decision Framework

Working session: 10-record validated sample + full 1,000-record schema (frozen 30 Jul 2026)

SITUATION

1,000 Stripe-connected startups tracked on revenue, subscriptions, and firmographic fields, plus acquisition-readiness data (asking price, revenue multiple). The source PDF export is reliable for short numeric/categorical fields but corrupts long text (names, URLs, personas) where columns overflow — so this pass leans on the clean, validated sample and full-dataset structure rather than unverified full-scale numbers.

WHAT WE'RE SEEING

Revenue is power-law distributed

One or two names (e.g. Stan) dwarf the rest — typical of creator/SaaS marketplaces. Averages will mislead; use medians and percentiles.

Followers ≠ revenue

Pearson $r \approx 0.14$ between X followers and MRR on the sample — audience size is a weak monetization signal on its own.

Subscriber count ≠ revenue quality

Some low-subscriber names post solid MRR — likely premium/B2B pricing vs. high-volume freemium. Worth splitting by pricing model.

Category mix is broad

E-comm, Marketing, AI, Analytics, Education, and more appear even in a 10-row slice — no single vertical benchmark will fit the full set.

Engagement fields are sparse

Visitors (30d) and revenue-per-visitor are unpopulated in the sample — conversion-efficiency analysis needs a more complete pull.

DECISION AREAS

Acquisition screening

Use revenue_multiple + asking_price against MRR growth to flag under/over-valued targets once those fields are populated.

Fair benchmarking

Compare startups within category and audience_type (B2B vs B2C) — cross-category averages will be misleading given the spread.

Growth-signal selection

Weight MRR growth %, active subscriptions, and revenue-per-visitor over vanity metrics like follower count.

Data reliability call

Decide whether to proceed on PDF-derived numbers (numeric fields only, flagged) or request a clean CSV/XLSX for full-scale, defensible analysis.

HOW WE'LL PROCEED

- 1 Source a clean CSV/XLSX of the full 1,000 rows — resolves the PDF text-overlap issue for names, URLs, personas.
- 2 Re-run correlation and Top-10 rankings at full scale (followers vs. MRR, active subs, visitors, revenue-per-visitor).
- 3 Segment every comparison by category and audience_type before benchmarking across startups.
- 4 Build an acquisition shortlist once asking_price and revenue_multiple are populated for on-sale records.
- 5 Layer in visitor and conversion metrics where available to separate reach from monetization efficiency.
