

TRUSTMRR DEAL FLOW

# Investment Screening Analysis

*Screening 1,000 micro-SaaS marketplace listings for acquisition-ready targets*

---

Prepared for the Investment Committee | August 2026  
Source: TrustMRR marketplace export, 1,000 listings

## EXECUTIVE SUMMARY

# A power-law market: a handful of assets carry the average, and most of the rest are mispriced

**78**

of 1,000 listings pass a basic acquisition-quality screen

**48x**

gap between mean (\$13.5k) and median (\$282) monthly MRR

**27%**

of listings are shrinking month-over-month, vs. 19% growing >10%

**38x**

typical asking multiple on monthly MRR — with a long overpriced tail

- AI is the most crowded category (197 listings, 20% of the market) but sits near the bottom on revenue quality — supply is outrunning demand.
- Subscriber count predicts revenue ( $r = 0.91$ ); social followers and domain authority do not ( $r \approx 0.02$ – $0.21$ ) — diligence should weight the former.
- Two listings — Notionlytics and DropPop — trade at 1–2x monthly MRR against a 38x market median: the clearest price/fundamentals mismatches in the dataset.
- 18 declining listings are still priced at 40–900x monthly MRR — sellers anchoring on historical peaks, not current trajectory.

## DATASET & APPROACH

# 1,000 listings, 29 fields — treated as a sourcing funnel, not a curated pipeline

### What the data is

- A point-in-time export from TrustMRR, a marketplace where founders list revenue-verified micro-SaaS and app businesses for sale.
- Financials (MRR, revenue, growth, subscriptions), traffic, firmographics, and deal terms (asking price, multiple, on-sale flag).
- Revenue is pulled from the seller's connected payment processor (mostly Stripe) — self-reported, not audited.

### Known gaps

- Traffic data: present for only 18% of listings
- Category: missing for 27% of listings
- Country: missing for 24% of listings
- 13% of listings are anonymized (“Stealth Company”)

### Screening logic applied throughout this report

1) Exclude \$0-revenue listings → 2) Keep only listings marked for sale → 3) Apply  $MRR \geq \$1,000$ , asking multiple  $< 60 \times$  monthly MRR, growth  $\geq -5\%/mo$  → 4) Rank survivors for diligence priority

## MARKET LANDSCAPE

**The market is a power law: outliers carry the average, most listings are tiny**

Listings by monthly MRR band

**\$282**

Median monthly MRR across all listings

**\$13,472**

Mean monthly MRR — skewed by a small number of outliers

**\$3.57M**

Highest single listing (Stan), MRR

*Implication: this is search-fund territory, not venture-style upside hunting — 61% of listings are sub-\$1k “side projects.”*

## MARKET LANDSCAPE

# AI is the most crowded category — and one of the weakest performers

Median monthly MRR by category (\$)

### AI CATEGORY

197

listings — 20% of the entire market

\$446

median MRR — bottom third of categories

Read: category popularity and revenue quality are inversely related here. Founders are launching into AI faster than customers are paying for it.

## MARKET LANDSCAPE

# A US-led, Stripe-native market — with a meaningful diligence blind spot

Listings by country (top 6)

**64%**

of listings run on Stripe — exportable, verifiable transaction history

**24%**

of listings have no country tagged at all

**13%**

of listings (129) are anonymized “Stealth Company” records — including two top-10 earners by MRR — unverifiable pre-NDA

## PERFORMANCE ANALYSIS

# More listings are shrinking than scaling fast

## Read

- 43% of listings show exactly 0% growth — the largest single bucket. Most of the market is plateaued, not compounding.
- 27% are actively declining month-over-month; only 20% are growing faster than 10%/month.
- Growth, where real, is concentrated in a minority — it should be the highest-weighted screening variable, ahead of absolute revenue size.

## PERFORMANCE ANALYSIS

# Subscriber count predicts revenue — followers and SEO authority don't

### Diligence takeaway

Weight subscriber counts and payment-processor data heavily. Don't let a large social following or SEO footprint substitute for verified financials — they barely correlate with revenue in this dataset.

## SCREENING METHODOLOGY

# A four-step filter turns 1,000 listings into 78 real candidates

### Step 4 filter criteria

- $MRR \geq \$1,000/\text{month}$
- Asking multiple < 60x monthly MRR ( $\approx 5x$  annual)
- Growth  $\geq -5\%/\text{month}$  (not sharply declining)

*78 candidates warrant a first look; the top 7 by price/fundamentals mismatch are detailed next.*

## SCREENING METHODOLOGY

# Seven names lead the shortlist on price-to-fundamentals mismatch

| Startup            | MRR      | MoM growth | Multiple (x MRR) | Asking price | Category  |
|--------------------|----------|------------|------------------|--------------|-----------|
| Notionlytics       | \$36,457 | -2.9%      | 1.3x             | \$48,000     | Analytics |
| DropPop            | \$27,797 | -0.3%      | 2.0x             | \$55,000     | SaaS      |
| Reloop             | \$1,119  | +24.3%     | 4.5x             | \$5,000      | Marketing |
| Linkedit           | \$1,036  | +90.1%     | 4.8x             | \$5,000      | Sales     |
| Leadbomb           | \$3,633  | +38.9%     | 6.9x             | \$25,000     | SaaS      |
| Speel.co           | \$65,843 | 0.0%       | 7.6x             | \$500,000    | SaaS      |
| Kickly – Pronos IA | \$10,236 | +384.5%*   | 9.8x             | \$100,000    | Games     |

*Notionlytics and DropPop show meaningful revenue at 1–2x monthly MRR — a steep discount to the 38x market median — the clearest first-call priorities. \*Kickly's growth figure is on a small base; verify before weighting.*

## DILIGENCE PRIORITY 1

# Notionlytics: \$36k MRR priced at a fraction of market multiples

**\$36,457**

Monthly MRR

**-2.9%**

MoM growth (mild decline)

**1.3x**

Asking multiple vs. 38x market median

**\$48,000**

Asking price

## Why this deserves a first call

- Analytics is a category with above-median revenue quality (category median MRR \$1,294) — this listing is well above that bar.
- At 1.3x monthly MRR (vs. a 38x market median), the price implies the seller either has an undisclosed problem or is simply mispricing a real asset — both are worth a direct conversation.
- Revenue decline is mild (-2.9%/month) — not the sharp deterioration seen in the “avoid” list later in this deck.

*Diligence focus: churn drivers behind the mild decline, customer concentration, and reason for sale.*

## DILIGENCE PRIORITY 2

# DropPop: \$28k MRR SaaS asset at 2x monthly revenue

**\$27,797**

Monthly MRR

**-0.3%**

MoM growth (essentially flat)

**2.0x**

Asking multiple vs. 38x market median

**\$55,000**

Asking price

## Why this deserves a first call

- Revenue is essentially flat (-0.3%/month) — a stable, retained-revenue base rather than a business in freefall.
- SaaS-category listings this size are uncommon; most SaaS listings in the dataset cluster near the \$303 category median — DropPop is roughly 90x that.
- At 2.0x monthly MRR, payback on the asking price would be under 2 months of cash flow if revenue holds — an unusually short payback for a stable asset.

*Diligence focus: verify Stripe-connected revenue directly, check for platform/API dependency risk, confirm reason for sale.*

## SCREENING METHODOLOGY

# 18 declining assets are still priced as if they were growing

| Startup            | MRR      | MoM growth | Multiple (x MRR) | Category         |
|--------------------|----------|------------|------------------|------------------|
| Launch Club        | \$29,100 | -11.8%     | 103x             | Marketing        |
| Yakkr Growth       | \$5,452  | -11.7%     | 138x             | Content Creation |
| Fiddl.art          | \$1,691  | -18.6%     | 917x             | —                |
| BambooVPN          | \$11,780 | -11.4%     | 68x              | Mobile Apps      |
| Blabla             | \$10,397 | -19.6%     | 48x              | AI               |
| MON RDV PREFECTURE | \$636    | -15.3%     | 102x             | SaaS             |

# 18

listings declining >10%/mo, priced >40x MRR

### Pattern

Sellers are pricing off historical peak revenue, not current trajectory — a hallmark of a business in decline being marketed as a growth asset.

*Recommendation: hard pass at asking price; revisit only if price drops more than 70%.*

## RISK FACTORS

# Five caveats limit how far this snapshot can be trusted

|   |                                      |                                                                                                                                                          |
|---|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>Self-reported financials</b>      | Revenue comes from the seller's payment-processor connection — not audited. Verify via direct dashboard access in diligence.                             |
| 2 | <b>Survivorship / selection bias</b> | Distressed businesses are over-represented among sellers — people sell when things go wrong, so the for-sale pool skews worse than the platform average. |
| 3 | <b>Anonymized listings</b>           | 13% of listings (129) can't be identity-verified pre-NDA — exclude from any ranked shortlist until confirmed.                                            |
| 4 | <b>Single-month growth figure</b>    | Only one trailing 30-day growth % per listing — no trendline. Request 6–12 months of history before committing capital.                                  |
| 5 | <b>Incomplete metadata</b>           | Category (27%) and country (24%) are frequently missing — segment-level stats are directional, not exhaustive.                                           |

## INVESTMENT THESIS

# This is a micro-PE roll-up opportunity, not a venture-style bet

### NOT THIS: venture-style growth hunting

- Betting on a handful of outliers reaching massive scale
- Underwriting pre-revenue potential over verified cash flow
- Chasing category hype (e.g. AI) for narrative, not fundamentals

### THIS: disciplined cash-flow acquisition

- Acquiring small, profitable, already-operating businesses at a discount to fundamentals
- Screening on verified subscriber counts and processor data, not vanity metrics
- Prioritizing categories with proven revenue density (Customer Support, Marketplace, Education) over hyped, crowded ones

## RECOMMENDED NEXT STEPS

# Screen monthly, diligence the mismatches, verify before wiring capital

1

### Run the screen monthly

Re-apply the 4-step filter (MRR  $\geq$  \$1k, multiple  $<$  60x, growth  $\geq$  -5%) as new listings appear on TrustMRR.

2

### Prioritize price/fundamentals mismatches

Lead with Notionlytics and DropPop — the two listings most decoupled from the 38x market pricing norm.

3

### Avoid AI as a blanket allocation

Select only AI-category names whose subscriber counts and growth genuinely back up the asking multiple.

4

### Require verified history pre-close

6–12 months of processor-verified revenue and direct dashboard access before any capital is committed.

### Bottom line

**TrustMRR is a viable sourcing funnel — but only with a strict, fundamentals-first screen. Buying at asking price without adjusting for growth and revenue quality would be value-destructive in most cases.**

*Questions & discussion*
