

Platform revenue depends on roughly 100 accounts, not on category mix

Strategic read of the TrustMRR 1,000-account dataset

83.7%

of 30-day revenue comes from the top 10% of accounts

87%

of revenue flows through Stripe-native companies (64% of the base)

21.6%

of accounts generated \$0 in revenue over the last 30 days

Cumulative share of revenue by account rank

So what: growth and risk strategy should be built around a small set of proven, scaled operators — not spread evenly across categories or countries.

02 — BUSINESS LANDSCAPE

The portfolio looks broad but is structurally shallow

A fifth of accounts earn nothing in 30 days, and over a quarter carry no category or value proposition

Distribution of 30-day revenue across all 1,000 accounts

21.6%

of accounts (216) show \$0 revenue in the trailing 30 days

27.4%

of accounts (274) carry no category label

28.4%

of accounts (284) have no stated value proposition

So what: the base isn't underperforming uniformly — it's bimodal. A real, monetizing core coexists with a long dormant/undocumented tail that dilutes every average-based read of "platform health."

03 — KEY REVENUE DRIVERS

Stripe-native companies capture 87% of platform revenue while representing 64% of accounts

Share of accounts vs. share of 30-day revenue, by payment infrastructure

Why it matters

Payment-infrastructure choice is a stronger, cleaner revenue-quality signal than self-reported category or persona fields — and it's fully populated (0% missing).

Implication

Use “Stripe-native” as a low-cost screening filter in underwriting, curation, and partner-tier decisions ahead of more expensive diligence.

04 — DEEP DIVE: CATEGORY ECONOMICS

AI leads categorized revenue at 28%, but the biggest “category” is the one nobody labeled

30-day revenue by category (\$, top 7 + uncategorized)

So what: at \$7.3M, Uncategorized alone exceeds all seven labeled categories combined (\$6.6M). Any category-led growth strategy is currently being built on 73% visibility — closing this tagging gap is a prerequisite, not a nice-to-have.

05 — HIDDEN INSIGHT

Stealth-mode companies out-earn named companies by ~33x at the median

Anonymity correlates with revenue maturity, not risk — and a distinct zero-revenue risk pocket sits underneath both

Median 30-day revenue: named vs. “Stealth Company” listings

Two findings, one theme

1. Stealth premium

129 stealth-listed accounts (12.9% of the base) generate \$4.14M — 26.5% of total platform revenue. Operators who keep their identity private tend to be further along, not higher-risk.

2. Silent-churn pocket

Among the 216 zero-revenue accounts, \$283K in MRR is still on the books, and 44 of them (20%) are already listed for sale — a signature of operators quietly exiting rather than truly starting out.

Four moves to convert these findings into action

1

Underwrite on infrastructure, not category

Add “Stripe-native” as a first-pass quality screen in curation, lending, and partner-tier decisions — it’s a stronger signal than self-reported category and it’s fully populated.

2

Close the tagging gap

Require category and value-proposition fields at listing/onboarding. At 27–28% missing, no category-led strategy can be trusted until this is fixed.

3

Build a stealth-account retention track

The 13% of accounts operating in stealth generate over a quarter of platform revenue — give them a dedicated success/retention motion rather than treating anonymity as a support gap.

4

Run a targeted zero-revenue / MRR audit

Investigate the 216 zero-revenue accounts still carrying \$283K in MRR, prioritizing the 44 already listed for sale, before they churn or exit quietly.

The path forward: scale and infrastructure quality, not category diversity, drive this portfolio

Top 5 leadership insights

- Revenue concentration is extreme: top 10% of accounts = 83.7% of revenue
- Stripe-native accounts: 64% of companies, 87% of revenue
- Uncategorized is the single largest “category” at \$7.3M
- Stealth accounts earn ~33x the median of named accounts
- 21.6% of accounts show \$0 revenue, yet still carry \$283K in MRR

Top 5 strategic recommendations

- Screen for payment infrastructure before category
- Mandate category / value-proposition fields at onboarding
- Stand up a dedicated stealth-account retention track
- Audit the zero-revenue, positive-MRR accounts for churn risk
- Re-baseline category strategy only after tagging gap is closed

Top 3 risks

- Silent churn: MRR on the books with no realized revenue
- Strategic blind spot: 27% of accounts untagged by category
- Single-account concentration: one account is 18% of revenue

Top 3 opportunities

- Formalize “Stripe-native” as an underwriting signal
- Build a stealth-segment success motion (26% of revenue)
- Win-back campaign for at-risk, positive-MRR accounts

Do this immediately

- Ship mandatory category/value-prop fields this quarter
- Pull the list of 44 for-sale, zero-revenue, positive-MRR accounts
- Brief underwriting on the Stripe-native revenue-quality signal
