

THE TRUSTMRR STORY

What 1,000 Verified Startups Reveal About Revenue, Reach, and Risk

THE DATASET

A snapshot of the micro-SaaS economy

1,000

startups tracked

\$334M

combined all-time revenue

65

countries represented

Financial fields (revenue, MRR, subscriptions) are 100% complete for every listing — this is a revenue-verification database, not a self-reported survey. Marketing metadata (traffic, positioning, pricing pages) is optional and often missing.

A handful of giants, a sea of side-projects

\$3,068

median 12-month revenue

\$133,750

mean 12-month revenue — 44x the median

Top earner: Stan, \$76.6M all-time revenue.
21.6% of listings report \$0 in the last 30 days.

AI is the category of this moment

27%

of categorized startups (197 of 726) are AI companies — more than the next three categories combined.

SaaS, Mobile Apps, and Productivity round out the top four — the dataset skews toward tools builders sell to other builders.

The US anchors the map, but the tail is global

34%

of geo-tagged startups are US-based (258 of 759)
— the single largest cluster by far.

65 countries appear in total. France, India, and the UK
form a clear second tier — the rest of the world
contributes a long tail of 1–15 startups each.

Businesses pay businesses more

B2B startups earn ~3.8x more than B2C at the median.

B2C is the larger segment by headcount (401 vs. 255 startups), reflecting how easy it is to launch a consumer app — but B2B's higher price points and lower churn translate directly into stronger revenue per company.

Not every spike is a success story

12,983%

30-day MRR growth reported by one “Stealth Company” — almost certainly a new payment integration surfacing historical MRR at once, not organic growth.

4–5

other listings show 1,000%+ growth in a single month — small enough absolute revenue that a handful of new customers reads as a moonshot.

Takeaway: extreme growth percentages on tiny revenue bases need a floor filter before they're used for benchmarking or ranking.

Behind the curtain: the anonymous economy

130

startups listed as “Stealth” or “Hidden” — 13% of the dataset

\$59.6M

combined all-time revenue from anonymous listings

17.8%

share of total dataset revenue that is anonymous

Real revenue, deliberately obscured — a reminder that headline totals include businesses whose founders, categories, and countries can't be verified.

Price tracks revenue — mostly at ~2x

262

startups (26%) are listed for sale

$r = 0.84$

correlation between asking price and 12-month revenue

2.3x

median revenue multiple among priced listings — a handful of sub-\$100 revenue outliers push the average far higher

Five things this dataset tells us

- 1 Revenue is a power law — a few giants (Stan, Brand On Demand) carry the mean; the typical listing earns a few thousand dollars a year.
- 2 AI and the US dominate what's being built and where — but both leaderboards have a long, global tail.
- 3 B2B commands a real revenue premium over B2C, even though B2C startups are more numerous.
- 4 Extreme growth figures on small bases are noise, not signal — filter before benchmarking.
- 5 The for-sale market prices almost entirely off revenue ($r = 0.84$), at a typical $\sim 2.3x$ multiple.
